## 1. Welcome to COPA-DATA help

#### **GENERAL HELP**

If you miss any information in this help chapter or have any suggestions for additions, please feel free to contact us via e-mail: documentation@copadata.com (mailto:documentation@copadata.com).

#### **PROJECT SUPPORT**

If you have concrete questions relating to your project, please feel free to contact the support team via e-mail: support@copadata.com (mailto:support@copadata.com)

#### **LICENSES AND MODULES**

If you realize that you need additional licenses or modules, please feel free to contact the sales team via e-mail: sales@copadata.com (mailto:sales@copadata.com)

### 2. Screens

Screens are central elements of a project. They display the configured equipment, inform, and provide user elements.

Screens consist of vector elements and/or dynamic elements. These are linked with variables or functions. Screens are configured in the main window of the Editor.

zenon provides a large number of pre-defined screen types, such as alarm information lists, trend screens etc. The advantage of this type of screen is that the desired functionality is connected to the

screen type. You must create the screen type and and you have a variety of pre-defined functions available. You can find an overview of screen types in the Types of screen (on page 306) section.

Part of the standard license of the Editor and Runtime.

#### **MAIN WINDOW**

In the main window documents such as screens, reports, etc. are displayed and edited. The main window is the only window that cannot be hidden.

#### OPEN MULTIPLE DOCUMENTS PARALLEL.

You can display multiple screens in the main window at the same time. This function can be activated via: *Options -> main window with tabs*. The screens can be selected with tabs at the top of the main window and can be positioned via options in menu item windows.

To close open screens, use the keyboard shortcuts Ctrl+F4, the context menu or the command Window -> Close.

#### **CONTEXT MENU DOCUMENTS**

Right-click on the tab of a document in order to open the context menu.

Parameters	Description
Save	Saves the document.
Close	Closes the document.
Close all others	Closes all other documents.

#### **POSITION ELEMENTS IN THE SCREEN**

Activate elements by clicking on the symbol in the Toolbar elements and open them with the mouse in the main window.

There are multiple possibilities for moving the elements:

▶ Move quickly: Click element and position it with the mouse

- ▶ Position exactly: Click element and position it with the arrow keys
- ► Turning: Turn element with the "handle" above the upper left corner as you like it.

#### POSITIONING OF ELEMENTS IN THE EDITOR AND IN RUNTIME

Elements can be positioned at different levels in the Editor and in Runtime. Individual elements can also be hidden (on page 305) in the Editor

**Attention:** Control elements are always displayed at the uppermost position. That also applies if they are covered by other elements in the Editor. This ensures that they can always be reached.

#### **ADJUSTMENT TO RESOLUTION**

Screens and their elements are automatically adjusted to the screen resolution in Runtime. This can be prevented. to display screen elements in the size and position configured in the Editor, activate the Do not adapt element to screen resolution property for the corresponding screen in the Size group.

# 3. Context menu project manager

Menu item	Action
New screen	Creates a new screen with the standard name 'Picture' as a standard screen type.
Export XML all	Exports all entries as an XML file.
Import XML	Imports entries from an XML file.  Note: Existing frames are not replaced during XML import using the Screens node. Existing frames are overwritten via the Frames node during XML import. In this case, all screens and their elements are adapted to the new frame.
Editor profile	Opens the drop-down list that includes pre-defined editor profiles.
Help	Opens online help.

## 4. Graphics quality

In zenon the quality of the displayed graphics can be tuned to the resources for the system. This setting is made using the project setting Graphics quality in group Graphical design. Possible options are:

- ▶ Windows Basic: Basic graphics settings. Recommended for resource-weak hardware.
- ▶ Windows Enhanced: Provides enhanced functions for the graphical display needs more resources.
- ▶ DirectX Software: Graphics calculations are done by the CPU. Depending on the graphic you can use more than one CPU. Using DirectX Software may cause a high CPU workload.
- ▶ DirectX Hardware: A part of the graphic calculation is done by the graphics card by which the performance is increased. If this setting is not supported by the used system, zenon automatically switches to DirectX Software. Generally speaking DirectX Hardware is preferable and DirectX Software should only be used if necessary.

- ▶ Windows Enhanced and DirectX are not available under Windows CE.
- DirectX display is only supported in the Runtime.

#### **DIRECTX**

DirectX allows a higher graphic quality than Windows Basic or Windows Enhanced. Thus in contrast to Windows Basic/Enhanced, DirectX can turn on/off properties Use antialiasing and ClearType fonts regardless of the settings in the operating system. The antialiasing quality of DirectXis higher than the quality of Windows Enhanced.

To use Directx, several requirements must be fulfilled:

Requirement	Description
DirectX Hardware or DirectX Software must be activated.	In the project settings you must select DirectX Hardware or DirectX Software for property Graphical design.
The operating system must support DirectX 11.	DirectX Hardware and DirectX Software only works on operating system supporting DirectX11:  Microsoft Windows Vista SP2 incl. Plattform Update and Windows 7  Windows XP and Windows CE are not supported  If the system does not support DirectX 11, it automatically switches to Windows Enhanced.
The current DirectX Runtime must be installed.	For zenon it is installed together with the setup. For the web client it must be installed manually.
The screen or element must support DirectX.	Only elements or screens which support DirectX can be displayed with DirectX.
For DirectX Hardware the minimum requirements must be fulfilled.	For details see minimum requirements graphics card. If they are not fulfilled, it automatically switches to <code>DirectX</code> Software.  If the operating system does not provide any hardware acceleration (e.g. Remote Desktop), it may not be possible to use <code>DirectX</code> Hardware.

### MINIMUM REQUIREMENTS GRAPHICS CARD FOR DIRECTX HARDWARE

For the use of DirectX Hardware the following minimum requirements must be fulfilled:

Parameters	Minimum requirements	Recommended
Graphics card:	Dedicated DirectX 11 AMD or nVidia graphics card	Dedicated DirectX 11 AMD or nVidia graphics card
Graphics memory:  (Actually needed size depends on the number of the called up screens and displayed elements.)	512 MB VRAM	1 GB VRAM
Driver graphics card:	Most current driver of the graphics card	d manufacturer

To check the graphics card support for <code>DirectX</code> Hardware, you can use the Windows operating system tool <code>dxdiag.exe</code>. With this the DirectX hardware capability of the graphics card and the driver

can be checked under Display with the value DDI Version. The value 11 for example means DirectX 11.

#### **DIFFERENCES BETWEEN DIRECTX AND WINDOWS ENHANCED**

DirectX differs from Windows Enhanced regarding quality, performance and resource requirements. Some of the most important differences:

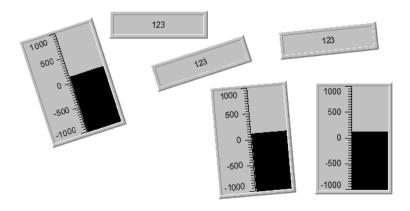

- Scaling, contortions and rotations of objects are displayed with antialiasing. Antialiasing also works with transformations.
- ▶ Shadows are displayed as a correct likeness of the actual element. Even texts and semitransparent bitmaps have a completely correct shadow. Dynamic changes are considered: If a button is clicked, the shadow also changes.
- ▶ Glow effect enables the glowing of an element via the likeness of the actual element. Even texts and semi-transparent bitmaps have a correct glow effect. Dynamic changes are considered: If a button is clicked, the glow effect also changes.

### **EXAMPLES**

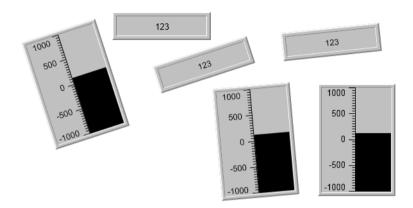

#### **ROTATED DYNAMIC ELEMENTS**

With Windows Enhanced:

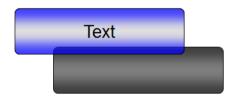

#### With DirectX:

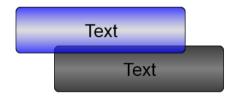

The forming of ridges at the edges is reduced, texts are positioned correctly.

#### **SEMI-TRANSPARENT BUTTON WITH SHADOW**

With Windows Enhanced:

With DirectX:

Correct shadow with visible text.

#### **SHADOW OF A BUTTON WITH BITMAP**

On the left a bitmpa button with shadow is displayed, on the right the same screen with property Transparent active.

#### With Windows Enhanced:

#### With DirectX:

### 4.1 Error treatment DirectX

Errors are displayed in the Diagnosis Viewer.

#### **DIRECTX IS NOT INITIALIZED.**

If DirectX cannot be initialized during the call up of a screen or in continuous operation,

- ▶ a progress bar is displayed
- ▶ it is tried to initialize DirectX again
- ▶ the Runtime continuous normally as long as the progress bar is displayed
- ▶ you can try to solve the problem (driver installation, ...)

The progress bar can be canceled by the user by clicking on button cancel. After the cancellation the Runtime is closed and an error message is displayed which can only be closed by clicking ox.

**Note:** For errors which make it impossible to reinitialize DirectX, an error message is displayed immediately.

#### **DIAGNOSIS VIEWER**

DirectX provides individual messages in the Diagnosis Viewer with:

- an error message
- possible reasons for the errors
- Error codes

The display take place in an own module pirectx. For errors the error text is displayed in text field Error. For warnings and debug information the corresponding messages are displayed in text field General:

- For the successful call up of a screen at least one DEBUG success message is displayed.
- Warning point out events which can influence the operation.
- If an error occurs which cannot be fixed, an error message is displayed.

### Info

If a message is not completely displayed in the table in the Diagnosis Viewer, open the entry via double click to display the whole message.

#### **CHECK LIST FOR ERROR CHECKING**

- An appropriate check whether DirectX works can be carried out by activating the debug message in the Diagnosis Viewer. For successful support, an appropriate message is displayed.
- Are DirectX-specific warnings or error messages displayed in the Diagnosis Viewer?
- Is property DirectX Hardware or DirectX Software activated in project setting Graphics quality?
- Are the minimum requirements for DirectX fulfilled? For details about minimum requirements see chapter Graphics quality (on page 12).
  - Is DirectX 11 supported by the operation system?
  - Is the current DirectX Runtime installed?
  - Is DirectX Hardware supported by the graphics card?

To check the graphics card support for DirectX Hardware, you can use the Windows operating system tool dxdiag.exe. With this the DirectX hardware capability of the

graphics card and the driver can be checked under <code>pisplay</code> with the value <code>pdI</code> version. The value <code>11</code> for example means DirectX 11.

- ▶ Is DirectX supported by the screen or the element?
- ▶ Does the display work properly with Windows Basis or Windows Enhanced?
- ▶ Does the display work with another driver?
- ▶ Does the display work with a graphics card of another manufacturer?

# 5. Detail view of toolbar and context menu screens

### **CONTEXT MENU**

Menu item	Action
New screen	Adds a new screen to the list and puts the focus onto this entry.
Open screen	Opens the main window for the screen highlighted.
Create standard function	Opens the assistants to select a picture and for the configuration of details, in order to create a suitable function automatically. The action is documented in the output window.
Linked elements	Opens drop-down list with option Jump back to start element.
	Click to go to the element from which you jumped to the screen.
Сору	Copies selected entries to the clipboard.
Paste	Pastes the contents of the clipboard. If an entry with the same name already exists, the content is pasted as "Copy of".
Delete	Deletes selected entries.
Export selected XML	Exports selected entries as an XML file.
Import XML	Imports XML files.
	Note: Existing frames are not replaced during XML import using the Screens node. Existing frames are overwritten via the Frames node during XML import. In this case, all screens and their elements are adapted to the new frame.
Create template for screen type	Opens dialog for creating a new template (on page 313) for adding control elements in the screen type.
Remove all filters	Removes all filter settings.
Edit selected cell	Opens the selected cell for editing. The binocular symbol in the header shows which cell has been selected in a highlighted line.
Replace text in selected column	Opens the dialog for search and replace texts in the selected language.
Properties	Opens the Properties window for the selected entry
Help	Opens online help.

# 6. Edit Screens Toolbar

A toolbar is available for editing screens. Per default, it is displayed below the menu bar.

Symbol	Function
(from left to right)	
Save screen	Save the current screen.
Save all	Saves all changed screens.
Cut	Cuts the selected element and stores it in the clipboard; works across projects, too. Only available if an element has been selected.
Сору	Saves a copy of the current screen to the clipboard. Only available if an element has been selected.
Paste	Inserts (i.e. pastes) a screen from the clipboard. Only available if the clipboard contains data.
Redraw screen	Refreshes the display.
Edit mode	Switches from Zoom to Edit mode.
Undo	Allows undoing up to 100 actions. By default, 10 actions can be undone.  Define the number of actions: Options -> Settings -> Settings -> number of undoable actions. Enter a number between 1 and 100.
Zoom	Provides two zoom modes:  Variable zoom: A predefined value can be selected from the combobox, or you can directly enter any value between 15% and 400%.  Zoom tool: You can zoom directly in the screen with the two magnifier symbols (+ and -). The CTRL key switches between the different modes. The defined zoom is saved for each single screen.  Close zoom mode: Click on the Edit mode symbol in the Elements toolbar.
Print	The whole screen content is printed on the default printer. Set printer properties via File -> Standard configuration -> standard.
Help	Opens the online help
Symbol bar options	Clicking on the arrow opens the submenu:  Active: Toolbar is displayed.  If the toolbar is not displayed, it can be activated using the Menu

Options -> Toolbar.

# 7. Toolbar elements

no.	Symbol	Function
01	Rectangle	With frame and fill color, type of frame and fill pattern
02	Line	With definable line thickness, color and type
03	Rounded rectangle	Rectangle with freely definable rounded corners
04	Ellipse/Circle	With frame and fill color, type of frame and fill pattern (circle)
05	Polygon	With frame and fill color, type of frame and fill pattern
06	Polyline	With line type and color (also filling pattern and color for an area description)
07	Arc of a circle	With definable line thickness, color and type
08	Segment of a circle	draw circle segment with an opening angle of 180º (changeable), definable line thickness, color and type
10	Static text	With font color and selection of the type of font
09	Tube	With frame and fill color, type of frame and fill pattern
11	Bar Graph	Display values as bar graph
12	Numerical value	Display values numerically
13	Dynamic Text	Display limit value texts
14	Trend Element	Simple line graphics
15	Indicating instrument	Value in instrument display
16	Status Element	Take colors from status configuration
17	Button	Operating field in button display
18	Switch	Simple command initiation or set value input element
19	Multi-binary element	Display several variables in one screen point in color and symbol (string)
20	Screen Alarm Button	Only available with a license for SICAM 230
21	Message element	Display texts from a text table
22	Clock	Date and time

23	Command Input Element	Only available with a license for SICAM 230
24	Combined element	Display one or more variables in color or symbol (chained characters)
25	Screen alarming	Only available with a license for SICAM 230
26	ActiveX element	Insert ActiveX control
27	Universal slider	Slider control
28	Combo/List boxes	Link values of variables with text messages
29	WPF Element	Displays valid WPF XAML files.
30	Edit mode	Switches from zoom mode to edit mode
	Symbol bar options	Clicking on the arrow opens the submenu:  Active: Toolbar is displayed.  If the toolbar is not displayed, it can be activated using the Menu <i>Options</i> - > <i>Toolbar</i> .

# 8. Context menu elements

Commands adapted to the situation are available to you in the context menu. You can also get to these commands using menus and toolbars.

Command	Description
Symbol	Opens drop-down list with commands. The following are available depending on symbol status:
	Create embedded symbol
	▶ Break up
	Changing to individual editing mode/leaving individual editing mode
	Insert in existing embedded symbol
	Convert linked symbol to embedded symbol
	Editing in the symbol editor
	Inserting in the symbol library
▶ Create embedded symbol	Creates an embedded symbol.
▶ Break up	Breaks up an embedded symbol into its screen elements.
Changing to individual editing mode/leaving individual editing mode	Switches to the individual editing mode or back to the symbol editing mode. The individual editing mode enables you to edit individual elements of a symbol.
Insert in existing embedded symbol	Inserts symbol into an existing embedded symbol.
Convert linked symbol     to embedded symbol	Converts a linked symbol to an embedded symbol.
▶ Edit in symbol editor	Opens a linked symbol in the symbol editor to edit it there.
Inserting in the symbol library	Opens dialog (on page 294) to add symbols from a screen of a symbol library.

Element position	Opens drop-down list for changing the position of the element:
	Foreground: Moves selected elements into foreground
	Background: Moves selected elements into background
	Forward: Moves selected elements one layer up
	Backward: Moves selected elements one layer down.
Arrange	Opens drop-down list for rearranging elements.
Linked elements	Opens drop-down list with dynamically linked elements, such as: Variables, functions, fonts, symbols etc.
Replacing links	Find/replace function e.g. tank 1 temperature is replaced by tank 2 temperature
Cut	Cuts the selected objects and stores them in the clipboard.
Сору	Copies selected objects
Paste	Pastes copied or cut objects form the clipboard.
Paste in same position	Pastes copied or cut objects form the clipboard.
Delete	Deletes selected objects
Transfer format (on page 213)	Transfers the properties of a selected element to another one / multiple elements.
	► Transfer to an element:
	Click on element with original properties
	-> Click on Transfer properties symbol or command in the
	context menu -> Click on target element: Properties are transferred
	► Transfer to multiple elements:
	Select source element -> Select target element with the Ctrl key held down (source and target element are highlighted) > Click on the Transfer properties symbol or command in the context menu -> Properties of the source element are transferred to the target elements.
	Source and target object determine which properties are transferred.

	If several elements were chosen as source, the properties of the first selected element are transferred.
Full screen mode	The full-screen hides all remaining windows and shows only the main window with all opened documents (screens, reports,) in full-screen mode.
	The full-screen mode can be closed by:
	► the displayed button for closing the full-screen mode
	► the short key Shift+F9
	► the key Esc
Redraw screen/symbol	Refreshes the display.
Display grid	Switches the grid on or off.
Use grid	Switches usage of the grid on or off.
	On: All objects are automatically aligned with the grid.
Use magnetic points	Switches magnetic points on or off.
	Use: If you move an object near the handling point of another object, it snaps in place at the handling point.
Zooming	Changes the resolution in fixed steps between 15% and 400%.
Screenshot print current screen/symbol	The current screen is printed on the standard printer. Set printer properties via File -> Standard configuration -> standard.
Insert vector graphics	Opens the dialog for inserting an external vector graphic.
Properties	Opens the property window for the selected element.
Help	Opens online help.

# 9. XML-Export and XML-Import

#### **EXPORTING SCREENS**

The included variables and functions are exported with the screens. The export file for the screens (on page 9) has the following sections:

- ▶ Screens
- Frames
- ▶ Symbols
- Variables
- Functions

To export screens:

- 1. highlight the desired screens
- 2. select Export selected XML... in the context menu of the detail view

  Alternatively: select, in the context menu of the Screen node, the XML export all...

  command
- 3. the selection dialog for the saving location is opened
- 4. select the desired saving location
- 5. assign a name
- 6. pay attention to file type XML
- 7. confirm by clicking on the **Save** button

The selected screens are exported to an XML file and can be imported in this or in other projects at any time.

#### **IMPORTING SCREENS**

To import screens:

- 1. in the context menu of node screens or in the detail view screens select the Import XML command
- 2. the selection dialog for the saving location is opened
- 3. navigate to the saving location of the desired XML file
- 4. Select the desired file
- 5. confirm the import by clicking on the open button

The screens are imported.

#### NAME CONFLICTS DURING THE IMPORT

At the import of a screen the name (attribute ShortName) which is stored in the XML file is used for the name of the screen which is created. If a screen with the same name already exist, the import is halted and an error message is displayed:

Parameters	Description
Yes	The screen described in the error message is replaced by the screen from the XML file at the import. If a new conflict occurs, the error message is displayed again.
No	The screen described in the error message is not imported. The existing screen is maintained. If a new conflict occurs, the error message is displayed again.
Yes, all	The screen described in the error message is replaced by the screen from the XML file at the import. This setting is used automatically when errors due to using the same name occur. All affected screen are replaced.
No, all	The screen described in the error message is not imported. The existing screen is maintained. This setting is used automatically when errors due to using the same name occur. All affected screen are maintained.

**Note:** Only the **shortName** is used. The file name does not matter for the name of the screens which should be imported. Thus it cannot be used to solve the conflict.

#### **VARIABLES AND FUNCTIONS IN SCREENS**

Dynamic elements (on page 30) and Frames (on page 242) are automatically imported together with the screens. Variables and functions have to be imported manually before from the same file.

Only variables and functions of the first level are treated, i.e. variables and functions that are directly linked to the screen. As on the one hand variables can be linked to functions (e.g. setting values) but on the other hand functions can be linked to variables (e.g. limit functions), it can be necessary to first import the variables, then the functions, and then the variables again. Then all links should work correctly.

**Example:** A screen contains a button with a function send value to hardware to a variable. The function is imported with the screen but not the variable.

Here we recommend using the XML Import Wizards.

### 10. Screen elements

You use two types of screen elements in zenon:

- 1. static vector elements
- 2. Dynamic elements

You have many key combinations available when editing screen elements. You can find details in the help, in the graphics key combinations (on page 221) section.

In this section, you can find information on:

- ▶ Insert into the main window
- ▶ Define properties
- ► Change element size
- Rotate element
- ► Sequence in Runtime

- Vector elements in zenon
- Dynamic elements in zenon

#### **INSERT INTO THE MAIN WINDOW**

The selected element can be selected several time in the main window and arranged there. Which element is selected and therefore active is shown by a symbol under the peak of the mouse pointer. To draw the template:

- 1. press the left mouse button
- 2. move the mouse
- 3. release the mouse button

Exception: Polyline, Polygon and tube

- ▶ A mouse click inserts a new supporting position
- ► A double-click or the Esc key stops pulling

Elements can be freely rotated with the mouse; to do this:

- 1. click on the element with the mouse
- 2. rotate it with the yellow sizing handle

The touch point and therefore the rotation point can be set in Reference point properties.

#### **DEFINE PROPERTIES**

For elements in the main window, the properties are set in Window Properties. The corresponding element must be activated in the main window to do this.

You can also select several elements at the same time and assign these common properties. For this, the following applies:

- ▶ Different values for different properties are marked in red.
- ▶ Properties which cannot be changed jointly are deactivated.

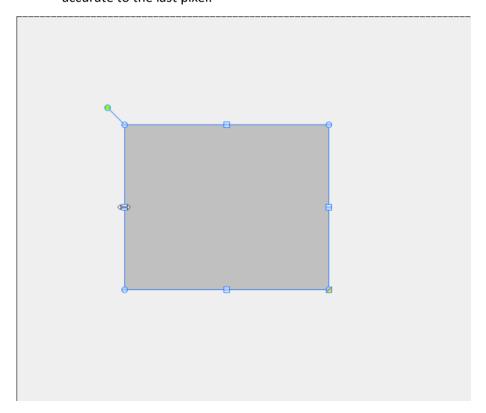

You also receive help instructions for the properties when the elements are created. To do this, activate the help window in zenon.

#### **CHANGE ELEMENT SIZE**

In order to change the size of an element, you can use the mouse, keyboard, properties or a dialog:

- ▶ With the mouse:
  - a) Click on one of the handles of the element frame
  - b) drag the element to the desired size
- With the keyboard:
  - Activate the desired sizing handle (mouse pointer must be over the sizing handle)
  - Drag it with the cursor keys:
  - By pressing a cursor key you change the position by 1 pixel.
  - With the Shift key: + cursor: By pressing a cursor key you change the position by 10 pixel.
- ▶ With the property window: In the property group Position you can enter the position and the size of the element accurate to the last pixel.
- ▶ With a dialog: Double clicking a handle opens a dialog in which you can enter the position accurate to the last pixel.

#### **ROTATE ELEMENT**

Elements can be rotated freely. The pivot point is set with the properties in the group Reference point.

You set the rotation angle as follows:

- With the mouse: Click on the element and rotate it with the help of the green handle.
- With the property window: With property Rotation angle [°] in group Position.
- With a dialog: A dialog is opened, in which you can enter the rotation angle, by double clicking the green handle.

#### Info

Window-based screen elements such as ActiveX, lists or combobox/listbox cannot be rotated in Runtime. Configuration in the Editor is possible for ActiveX, but this has no effect on the display in Runtime.

#### **SEQUENCE IN RUNTIME**

In Runtime, the following sequence is generally applicable for the display of elements, from top to bottom:

- WPF element, always in the foreground
- ActiveX Element, always in the foreground, except if it is overlaid by a WPF element
- Dynamic elements and vector elements

#### **COVERED ELEMENTS**

The following applies for overlaid elements:

- If a vector element overlays a dynamic element:
  - the dynamic elements or the overlaid part is not displayed
  - The dynamic elements can be operated, even if they are fully covered.
- If several dynamic elements are overlaid, only the visible (clickable) parts can be operated.

Elements that are covered in Runtime can be controlled with the keyboard. For details on configuration, see the Runtime manual, Defining sequences in frames chapter.

### **VECTOR ELEMENTS IN ZENON:**

You create vector elements in zenon with the character editor. Select the desired element in the Elements toolbar (on page 22) or in the drop-down list and place it in the main window using the mouse. Configure the properties with the Properties window. The element must be selected in the main window to do this.

Element	Properties
Ellipse (on page 97)	With frame and fill color, type of frame and fill pattern
Circle (on page 97)	Select the ellipse symbol and hold down the Shift key when drawing; with frame and fill color; type of frame and fill pattern
Arc of a circle (on page 98)	With definable line thickness, color and type
Segment of a circle (on page 99)	With definable line thickness, color and type
Line (on page 100)	With definable line thickness, color and type
Polygon (on page 110)	With frame and fill color, type of frame and fill pattern
Polyline (on page 112)	With line type and color (also filling pattern and color for an area description)
Square (on page 114)	select Rectangle symbol, hold down the Shift key when drawing; with frame and fill color; type of frame and fill pattern
Rectangle (on page 113)	with frame and filling color, type of frame and fill pattern
Rounded rectangle (on page 113)	with frame and filling color, type of frame and fill pattern
Tube (on page 114)	With frame and fill color, type of frame and fill pattern
Static text (on page 116)	With font color and selection of the type of font

#### **IMPORTING YOUR OWN VECTOR GRAPHICS**

Vector elements that have been created in external programs can be imported as a screen and included. To do this, go to *Files-> Graphics -> Add file in the project manager*.

#### **DYNAMIC ELEMENTS IN ZENON**

You create dynamic screen elements in zenon with the character editor. Select the desired element in the Elements toolbar (on page 22) or in the drop-down list and place it in the main window using the mouse. Configure the properties with the Properties window. The element must be activated in the main window to do this. Graphic elements can be activated directly here through variables. For many elements, a configuration dialog is shown when they are being created.

#### Dynamic elements in zenon:

Element	Function
ActiveX (on page 39)	Inserts any desired ActiveX elements. These must already be installed on the computer.
Bar Graph (on page 41)	Displays the size of a signal in bar form. In doing so, the length of the bar changes with the signal size.
Command Input Element (on page 43)	Makes it possible to send commands for the Command Input module. Requires license forSICAM 230.
Screen Alarm Button (on page 43)	Enables alarming with color and flashing via the screen. Requires license forSICAM 230.
Bitmap Button (on page 46)	Links a graphics file (pixel graphics: *.bmp, *.jpg, *.gif, or *.png or vector graphics: *.wmf) with a button.
	Attention! This element is only available if the project property Create RT files for has been set to lower than 6.50. This function has been integrated into the element button from version 6.50.
Button (on page 43)	Enables actions such as execute function or target value to be instigated. It can display text and graphics and be created as a transparent object via other elements.
	Attention! If the project property Create RT files for is set to lower than 6.50, only text output is displayed in runtime. Graphics and the invisible function must then be configured with the bitmap button and the invisible button elements. You then find these two elements at the bottom of the elements drop-down list.
Combined element (on page 51)	Displays statuses of variables via symbols, screens and texts in graphic form also be used as a switch or as a button.

Combo/List Box (on page 88)	Displays a text in a combo box or a list box regardless of variable value. When an entry is selected, the attendant value is sent or the attendant function is executed.
Dynamic Text (on page 96)	Displays the value of a string variable in alphanumeric form or the current limit text of numeric variables.
Message element (on page 101)	Reads text from a text file, depending on two variables, and displays this.
Multi-binary element (on page 103)	Enables, independently of variable values, a graphic to be displayed or symbols to be colored and a status text to be provided.
Switch (on page 116)	Displays values of a binary variable and modifies these.
Move Symbol (on page 118)	Enables a symbol to be moved, rotated and changed in size regardless of variable values.
Trend Element (on page 118)	Displays values in the form of trend curves.
Clock (on page 120)	Displays the current time and date.
Universal slider (on page 122)	Provides sliders in different graphical forms.
Invisible Button (on page 49)	Transparent object, with which actions such as execute function or define set value can be triggered.
	Attention! This element is only available if the project property Create RT files for has been set to lower than 6.50. This function has been integrated into the button element from version 6.50.
WPF Element	Displays WPF-XAML files in zenon.
Numerical value (on page 191)	Displays the value of a variable in numerical form.
Indicating instrument (on page 192)	Displays the value of a variable in the form of an analog measuring tool with a indicator as display element.
Status Element (on page 193)	Transfers properties from linked variables to a symbol and displays statistical limit texts.
	I .

#### **DEFINE PROPERTIES**

For many dynamic elements, a configuration dialog opens to select variables and/or functions that define the elements in runtime. The properties can also be set independently of the configuration dialog in the properties window. They can be changed at any time here. The corresponding element must be activated in the main window to do this.

You can also select several elements at the same time and assign these common properties. For this, the following applies:

- ▶ Different values for different properties are marked in red.
- Properties which cannot be changed jointly are deactivated.

You also receive help instructions for the properties when the elements are created. To do this, activate the properties list in zenon.

# **DISPLAY IN THE MAIN WINDOW**

You can obtain information on a dynamic element in the main window by:

Tool tip when the mouse is moved over it:

- ▶ Element type
- ▶ Element name
- ► Function name/function type
- ► Linked variables

In the status bar on activation:

- ► Mouse pointer position
- ▶ Element type
- ▶ Element name
- ▶ Start point
- Width/height

# 10.1 .NET Controls

The ActiveX control cd\_dotNetControlContainer.Container makes it possible to use any .NET Windows Forms Controls as dynamic elements in zenon. In doing so, all functions implemented in the .NET control are supported. It can be used with all zenon versions from 5.50 on which support ActiveX.

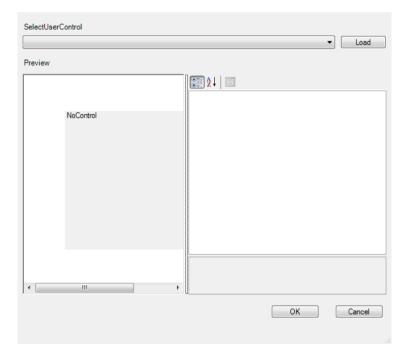

Note:.NET Framework 3.5 must be available.

You can read more about the use of .NET with zenon in the Programming interfaces manual in the .NET chapter.

To use the ActiveX control  $\mathtt{CD\_DotNetControlContainer}$ . Container:

- 1. create a dynamic element of the type ActiveX (on page 39)
- 2. select CD\_DotNetControlContainer.Container from the list of available controls
- 3. click on button Properties
- 4. the dialog for configuring the control opens

Parameters	Description	
Load	Opens the file manager for selecting a .NET Control Assembly.  Note: The .NET Control Assembly must be in the same folder as Runtime. It is always the absolute path to the .NET Control	
	Assembly that is saved, e.g.: C:\Controls\Assembly.dll.	
SelectUserControl	Selection of the .NET Controls from the ones available in the selected .Net Control Assembly.	
Preview	Displays the absolute path to the .NET Control Assembly.	
	Field left below: Preview of the control.	
	Field right below: Property list for the selected .NET Control.	
Symbol: By categories	Displays properties sorted by categories.	
Symbol: Alphabetical	Display properties in alphabetic order.	
Symbol: Property pages	Displays property pages.	
OK	Confirms configuration. This is then saved in the zenon ActiveX element as XML stream.	
Cancel	Cancel configuration.	

#### 10.2 **ActiveX**

You connect ActiveX elements in projects using the ActiveX dynamic element.

# 💡 Info

You can read more about the use of ActiveX with zenon in the Programming interfaces manual in the ActiveX chapter.

# To create ActiveX in a screen:

- 1. select the ActiveX symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window
- 3. pull the control element open while pressing and holding the left mouse button

- a configuration dialog opens, in which you can select the element and configure it
- The shape, size and position can be changed at any time by pulling the vertexes or moving the element
- 6. if you press and hold alt while pulling the outer corner points, the change is carried out symmetrically

You define individual properties of the element in the property window. In order to do this, the element must be active (mouse click) in the main window. To subsequently select or change controls, open the configuration dialog by double-clicking on the properties menu item in the context menu.

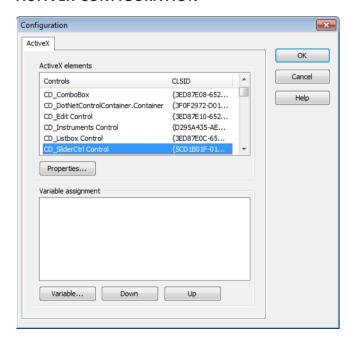

# Attention

Only ActiveX elements that are installed and registered on the computer are shown. Please ensure that all ActiveX elements are also installed on all Runtime systems on which you use the project.

You can also use Remote Transport to register ActiveX elements on remote systems. See: Define files (copy&register)

## **ACTIVEX CONFIGURATION**

Element	Function
ActiveX elements	List of all ActiveX elements available.
Properties	Opens a configuration dialog for the ActiveX highlighted, if available. You can obtain help and information about the configuration from the manufacturer of the respective ActiveX control.
Linking variables	List of variables linked to the ActiveX element.
Variable	Opens the zenon Dialog to select variables if it is possible to link variables.
Down	Sorts highlighted variables downwards.
Up	Sorts highlighted variables upwards.

# **POSITION CHANGE IN RUNTIME**

ActiveX controls work with untransformed mouse coordinates in Runtime. If an element is rotated, stretched or otherwise changed in terms of its size or position, the control no longer fits and continues to be executed at the original position. The transformed element can therefore no longer be operated at its transformed position using the control.

# Info

Regard the difference between windowed and windowless ActiveX elements.

Windowed ActiveX elements (e.g. all Microsoft ActiveX Controls) are always in teh foreground.

In contrast you can place for example a dynamic element over windowless ActiveX elements.

#### **Bar Graph** 10.3

You show the numerical size of a signal with the Bar graph dynamic element. The length of the bar changes with the signal size in runtime.

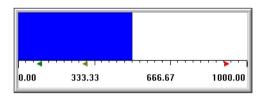

To create Bar Graph in a screen:

1. select the Bar graph symbol in the Elements tool bar or in the Elements drop-down list

- 2. select the start point in the main window
- 3. pull open the element while pressing and holding the left mouse button
- 4. the dialog to assign a variable (on page 238) opens
- 5. The shape, size and position can be changed at any time by pulling the vertexes or moving the element
- 6. if you press and hold alt while pulling the outer corner points, the change is carried out symmetrically

You define individual properties of the element in the Properties window. In order to do this, the element must be active (mouse click) in the Main window.

To edit the linked variable:

- 1. open the variables in the Project Manager Detail view,
- 2. drag the desired variable onto the element while holding the left mouse button
- 3. the previous variable is substituted by the new one

# **COLOR-CODED DISPLAY OF THE LIMIT VIOLATION**

At limit violations the color from the variable can color the whole area or only the area starting from the limit violation. This functionality is controlled via property Explicit in group Representation.

This property affects only the display of values with defined limits from variables. Limits from reaction matrices are not considered.

Active: If a limit of the linked variable is violated, only the part of the display which reaches into the limit violation is displayed in the color of the respective limit.

If the variable has several defined limits, the respective areas of the display are always displayed in the color of the corresponding limit.

Inactive: If a limit of the linked variable is violated, the complete display is displayed in the color of the violated limit.

Default: inactive

#### **Command Input Element** 10.4

Makes it possible to send commands for module Command. Requires license for SICAM 230.

You can find instructions on how to use elements in the help at SICAM 230.

#### **Screen Alarm Button** 10.5

Attention: The screen alarm button requires a license for SICAM 230. You can find further instructions on how to use elements in the help at SICAM 230.

#### 10.6 **Button**

You create a freely adjustable button the the dynamic element button which you can use interactively in the screen to either carry out a function or as a switch for a binary variable.

The button can

- display a graphics file
- animate a graphics file
- be displayed invisibly

# Info

Buttons are subdivided into text button, bitmap button and invisible button in versions up to and including version 6.22. From version 6.50, all properties that can be configured with buttons are together in the element button.

To create the dynamic element button in a screen:

- 1. select the Button symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window
- 3. pull open the element while pressing and holding the left mouse button
- 4. The Selection dialog functions (on page 237) open
- 5. select the desired function
- 6. Define the desired properties in the properties window

Hint: You can round (on page 195) the corners as you wish

7. You add variables by dragging & dropping

### **LABELING**

To label the button:

- ▶ Click in the element.
- enter the text
- ▶ define the text properties in the Representation node

# **UNDERLINE**

To underline text, place a & in front of the text to be underlined.

&Text becomes:

If you would like to use the character '&' in text, enter it twice: 1 && 2 becomes 1 & 2.

# **LINE BREAK**

To define a line break, use the string \n.

Example:

Line 1 \n

Line 2

### **BUTTON AS SWITCH**

To use the button as a switch:

- 1. activate the Switch property in the Write set value node
- 2. You activate settings to use the button as a momentary switch with the Momentary switch property
- 3. Link the button with a binary variable (node Variable / function, property Variable)

# **BUTTON TO EXECUTE A FUNCTION**

To link a button to a function:

- 1. deactivate the Switch property in the Write set value node
- 2. Link the button with a binary variable (node Variable / function, property Function)

### **BUTTON WITH GRAPHICS**

To put graphics on the button:

- 1. activate the element
- 2. define the desired graphics for the different switch states in the Representation node via Graphics file properties and "Pressed button graphics". You can use the following graphics files: Pixel graphics: \*.bmp, \*.jpg, \*.gif, or \*.png or vector graphics: \*.wmf.

A button with graphics has a thin 3D frame line as standard, which covers a pixel on each side of the graphic. If the graphics are to be visible, then:

- ► In the button properties, select the Transparency border color [%] property in the Color group
  - with the value 100

or

Activate the Transparent property to deactivate background color and frame color

This causes the 3D frame line to not be displayed and the whole graphic is visible.

# **INVISIBLE BUTTON**

to define an interactive, transparent user interface:

- 1. activate the element
- 2. definite the Transparent property in the Color node
- 3. remove all labeling from the button
- 4. Access to Runtime:
  - The mouse pointer changes when the mouse is moved over the element
  - over a defined key combination (Runtime node, Key combination property)

The status of the variable cannot be displayed for the invisible button.

# 10.6.1 Animate graphics

GIF graphics files can be animated in the dynamic element button:

- 1. assign a GIF file to a button in the Representation node via Property Graphics file
- 2. select the property GIF animation in the same node
- 3. choose between Always or animation only if a Boolean variable has a value of 1: To do this, link the properties of both properties Variable

# 10.6.2 Bitmap Button (up to version 6.22 only)

Links a graphics file (pixel graphics: \*.bmp, \*.jpg, \*.gif, or \*.png or vector graphics: \*.wmf) with a button.

If the project property Create RT files for is set to small 6.50, the element button can only display texts in runtime. Graphics must be configured by means of the bitmap button in this case.

Engineering buttons for different Runtime versions:

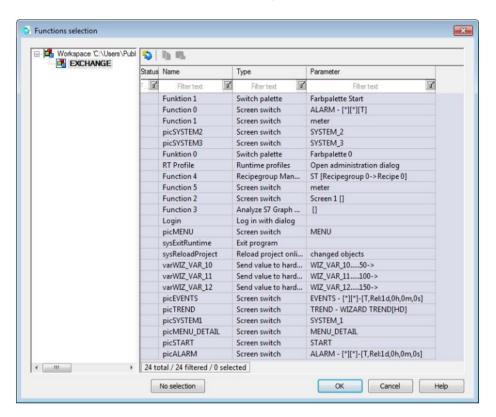

Button for	Create RT files for < 6.50	from 6.50
Text	Button	Button
Graphics	Bitmap Button	Button
invisible	Invisible Button	Button

# to activate a bitmap button:

- ▶ select the Bitmap button symbol in the Elements tool bar or in the Elements drop-down list
- select the start point in the main window
- ▶ pull open the element while pressing and holding the left mouse button
- ▶ a dialog opens, in which you can link the desired function to the element
- ► The shape, size and position can be changed at any time by pulling the corner points or moving the element
- ▶ if you press and hold the alt key while pulling the outer corner points, the change is carried out symmetrically
- ➤ You define individual properties of the element in the property window. In order to do this, the element must be active (mouse click) in the main window.

Element	Description	
Project tree	Definition of the project from which the function should be selected.	
Selection window	Selection of the function.	
No selection	Depending on the element:	
	► the dialog is canceled	
	► already linked functions are deleted	

**Hint:**The size of this dialog can be adjusted. The dialog size and position are saved.

# **CHANGE LINKED FUNCTION**

- 1. manually
  - in the Project Manager's Detail view open the functions
  - drag the desired function on the element while holding the left mouse button
  - the previous function is substituted by the new one

### 2. automatic

 Select the entry Replace links from the context menu. For more details see chapter Substitution of variables and functions in dynamic elements (on page 225).

GIF graphics files can be animated in the dynamic element button:

- 1. assign a GIF file to a button in the Representation node via Property Graphics file
- 2. select the property GIF animation in the same node
- 3. choose between Always or animation only if a Boolean variable has a value of 1: To do this, link the properties of both properties Variable

# 10.6.3 Invisible button (up to version 6.22 only)

If the project property Create RT files for is set to small 6.50, the element button can only display texts in runtime. Invisible buttons must be configured with the invisible button element in this case.

Engineering buttons for different Runtime versions:

Button for	Create RT files for < 6.50	from 6.50
Text	Button	Button
Graphics	Bitmap Button	Button
invisible	Invisible Button	Button

The dynamic element Invisible Button offers the possibility to define an interactive transparent user interface which is linked to a function call.

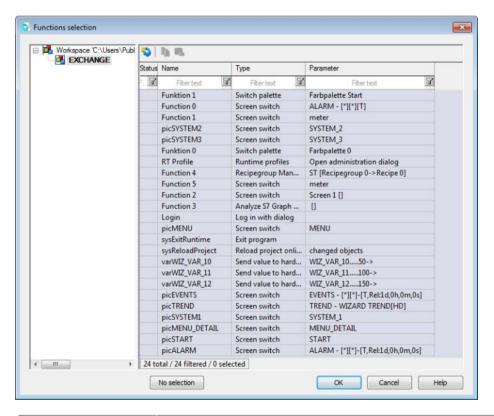

To activate an invisible button:

- ▶ select the Invisible Button symbol in the Elements tool bar or in the Elements drop-down list
- select the start point in the main window
- ▶ pull open the element while pressing and holding the left mouse button
- ▶ a dialog opens, in which you can link the desired function to the element

- ► The shape, size and position can be changed at any time by pulling the vertexes or moving the element
- ▶ if you press and hold the alt key while pulling the outer corner points, the change is carried out symmetrically
- ➤ You define individual properties of the element in the property window. In order to do this, the element must be active (mouse click) in the main window.

In order to select functions, a filtered dialog is opened:

Element	Description	
Project tree	Definition of the project from which the function should be selected.	
Selection window	Selection of the function.	
No selection	Depending on the element:	
	► the dialog is canceled	
	<ul> <li>already linked functions are deleted</li> </ul>	

**Hint:**The size of this dialog can be adjusted. The dialog size and position are saved.

### **CHANGE LINKED FUNCTION**

- 1. manually
  - in the Project Manager's Detail view open the functions
  - drag the desired function on the element while holding the left mouse button
  - the previous function is substituted by the new one
- 2. automatic

Select the entry Replace links from the context menu. For more details see chapter Substitution of variables and functions in dynamic elements (on page 225).

# Info

The status of the variable cannot be displayed for the invisible button.

#### 10.7 **Combined element**

The combined element is a dynamic element that can be used universally and can adopt the most varied graphic characteristics:

- Graphics
- Symbol from library
- Symbol embedded in screens
- Text

The form of the display is defined through statuses. Variable values of the main value, values of further values and status information from all linked variables can all serve as statuses. Links can be created as desired via formulas.

Statuses of the main variables (limit attributes) can be transferred directly to the combined element. The combined element also supports the setting of set values in the form of a switcher/momentary switch as well as the sending of and sending functions and serves to implement technical processrelated elements for Automatic Line Coloring.

If set values are set via command input and a response variable is set in the combined element dynamic element, it can be set regardless of the setting of the Setting values active property. All action

buttons in the command input screen that trigger a direct modification of the response variable are then set to invisible.

#### **CREATE A COMBINED ELEMENT**

To create a combined element in a screen:

- 1. Click on the Combined Element symbol in the Elements toolbar (on page 22) and drag the element to the main window with the mouse.
- 2. The variable selection dialog opens, filtered for numeric variables.
- 3. Select the desired variable
- 4. The Assistant (on page 54) for combined element settings opens and guides you through the basic settings. If you prefer to define all settings manually, click on cancel now. You can find details in the Assistant. (on page 54) chapter

When setting up manually, define the Type of display in the Representation node. The symbol from the library is given as a default. You can define screen data and text according to the settings.

You define additional statuses either in the assistant via the New Status or in Combined Element Properties in the display with property node Configuration and test.

Functions and variables can be assigned to the combined element by dragging & dropping. In doing so, the respective variables/functions are each replaced by the new ones.

# Attention

Symbols in a "Combined" element cannot be operated.

Exception: Symbols from the library can be created as clickable buttons (on page 59).

## **LINK RULES**

If you have selected Symbol from Library as a display type, you can enter link rules. You open the dialog for entering the element via the Configuration and test property. After selecting the symbol via the Symbol Select button, you can create and edit linking rules. These rules are saved for every status.

# **Example**

Variables/functions contained in the symbol:

Var\_SWITCH\_0010 Var\_TEMPERATURE\_0010 Fct\_ShowTrend\_0010 Fct\_Help\_0000

The variables and functions of the symbol are now replaced with the following rule:

Source: \*\_0010 replace with: \_0020

result of linking rule:
Var\_SWITCH\_0020
Var\_TEMPERATURE\_0020
Fct\_ShowTrend\_0020
Fct\_Help\_0000

With the help of the linking rule, all variables and functions can be exchanged. If a variable or function does not fit into the scheme, that link cannot be replaced.

When the runtime files are created, the respective links are set for every status, according to the rule.

# Example

You would like to graphically display if a motor is switched on and in which direction it is turning.

Information about run direction and on/off state comes from the variables on the control side. The status text displays whether the motor is turning and how it is turning.

- ► Select Properties -> Display Type -> Status Text.
- ▶ Open the Enter Element dialog by clicking on Configuration and test.
- ► Enter the status text which you want to allocate to the respective value.

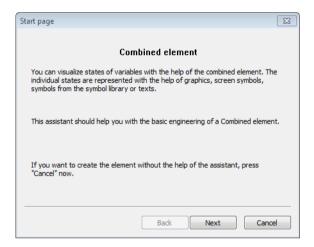

It is subsequently displayed in your motor during runtime, for example: 'left', 'right' or no text at all if the motor is not turning.

You will find more information about the evaluation of the status bits in the chapter Statuses (on page 63).

# 10.7.1 Assistant

An assistant is available for the basic configuration of the combined element. This opens as soon as you have selected a variable for the combined element.

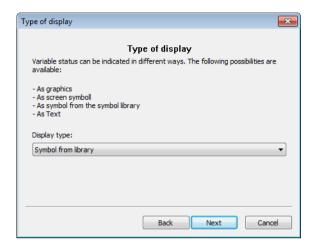

In the first step, you select the display type. The following display types are available:

- Symbol from Library
- Status Text and Screen Symbol
- Bitmap and Screen Symbol
- Screen Symbol Only

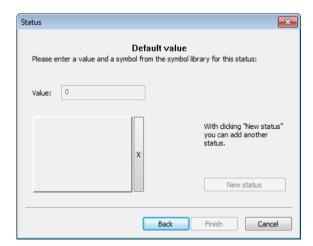

Default: Symbol from library.

This setting is also displayed as standard in the properties if you create the combined element without the assistant.

You can define statuses as soon as you have selected a type of display. The first status is always the default status.

Hint: A value cannot be entered for the default status; a value must be entered for all other statuses. You can only edit one status at a time.

### SYMBOL FROM LIBRARY

Click on the empty window at the bottom left to select a symbol from the global symbol library or from the project library. You can delete the selected symbol again by clicking on the X next to the window.

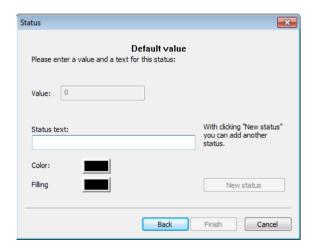

Setting	Description
Value	Numerical value at which the status becomes active.
	Default: no value
	From 2nd status: Entry required.
New status	Creates a new status for the combined element.

For Symbol from library, clickable buttons (on page 59) can be created in any form.

# STATUS TEXT AND SCREEN SYMBOL

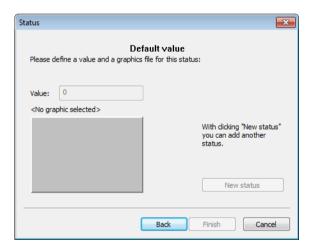

Each condition can be labeled with a text and with a foreground and background color.

Setting	Description
Value	Numerical value at which the status becomes active.
	Default: no value
	From 2nd status: Entry required.
Status text	Text as it is displayed in runtime.
Color	Font color of the status text.
Filling color	Background color of the status text.
New status	Creates a new status for the combined element.

### **BITMAP AND SCREEN SYMBOL**

Click on the <No graphic selected> button at the bottom left to select a screen file (\*.bmp, \*.gif, \*.jpg, \*.png etc.). You have two options for screen selection:

# 1. Pictures from the project:

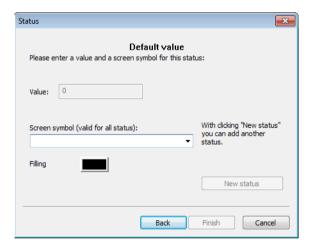

Pictures which you have already stored in the graphics directory of a project (see chapter on Editor -> Project Manager -> Files) are offered to you automatically by the assistant.

- 2. Absolute path to other directories:
  - Activate direct file selection for this
  - The window switches to direct selection
  - Click on the button ...
  - Select the corresponding file with the explorer

Setting	Description
Value	Numerical value at which the status becomes active.
	Default: no value
	From 2nd status: Entry required.
New status	Creates a new status for the combined element.

# **SCREEN SYMBOL ONLY**

You can give a common symbol for all combined element statuses. This symbol:

- must already be present on the screen
- applies for all statuses
- ▶ can be labeled for each status with its own filling color

Setting	Description	
Value	Numerical value at which the status becomes active.	
	Default: no value	
	From 2nd status: Entry required.	
Screen symbol	Drop-down list to select a symbol.	
	If no symbols are displayed, then no symbols are present in the current screen.	
Filling color	Names the allocated status.	
New status	Creates a new status for the combined element.	

#### Clickable buttons in any form 10.7.2

In the combined element, clickable buttons can also be created in any desired form.

This option is available from version 6.51. For projects for earlier versions, the property is treated as inactive.

To create clickable buttons in any form desired:

- 1. Create a combined element in the symbol from libraryattributes
- 2. In combined element properties, activate the Symbol form defines the click area property in the Representation node

This property does not work under Windows CE, because the required functionality is not available under Windows CE.

# **ELEMENTS**

There can be further symbols or combined elements in the symbol. These are triggered correctly corresponding to the click area. For symbols, the element limits are used completely normally, with a

combined element this depends on the Symbol form defines the click area property, either the individual click areas of the elements or the environment rectangle of the combined element.

The following elements have their own special click area:

- ► Rounded rectangle (present as its own vector element up to version 6.50)
- ▶ Button
- Combined element with "Symbol form for click area" property
- ► Circle
- ▶ Segment of a circle
- ► Arc of a circle
- ▶ Line
- ▶ Pipeline
- ▶ Polygon
- Polyline
- ▶ Rectangle
- Static text
- ▶ Symbol (correct click areas of the symbol elements are used)

All other elements have their surround as a click area.

# **SPECIAL ATTRIBUTES**

Special attribute	Effect
Are never treated specially:  Type of line Filling pattern Transparencies of all type (except text element)	Areas are always clickable.
Transparency for static test:  Elements behave as though the element did not exist. As a result, it is possible to name elements without unintentionally enlarging the click area.	Does not influence the click area.  Hint: If a transparent text element is to influence the click area:  Deactivate the Transparent property  Place a transparent element over or under this manually
Button	Is used for the click area; GIF animation for "pressed" is not available here. This corresponds to the behavior with an inactive Symbol form defines the click area property.
Symbol protrudes from the combined element.	Symbol is displayed, but clicks are only interpreted within the combined element.  Comment: If elements protrude outside symbol limits or symbols protrude out from the limits of a combined element, this can lead to display problems and blurring effects.

# **CLICK AREAS**

In the Editor, areas larger than the click area are sometimes defined, in order to make these easier to click on. For example, a line with 1 pixel thickness in the editor can be selected using a width of 8 pixels.

The display of the click area is exact in Runtime. For example, a line of 1 pixel thickness is also only selectable from a width of 1 pixel.

The calculation of the click area for the combined element works regardless of the Graphics quality property's setting. However, a different click area is calculated for the elements regardless of this setting.

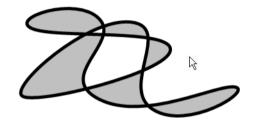

If the mouse pointer is above the combined element, it is analyzed whether the cursor is in the click area of the element. The load placed on the CPU can then be high with a large number of elements in the combined element symbol.

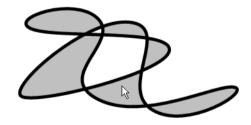

# **Example clickable buttons**

# **EXAMPLE 1**

status Symbol form defines the click area	Action
active	No click
inactive	Click

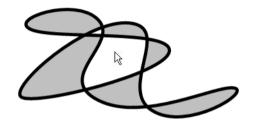

# **EXAMPLE 2**

status Symbol form defines the click area	Action
active	Click
inactive	Click

# **EXAMPLE 3**

status Symbol form defines the click area	Action
active	No click
inactive	Click

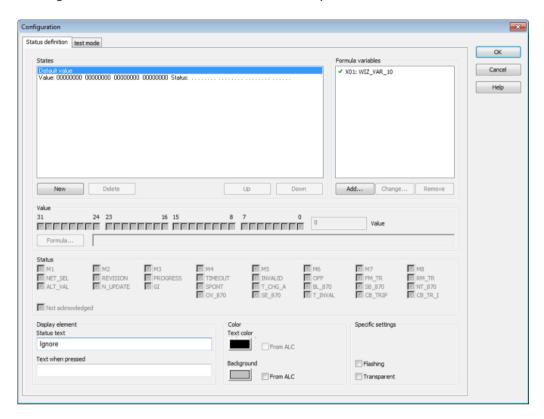

# 10.7.3 Statuses

You get to the statuses window via the  ${\tt Configuration}$  and test property in the  ${\tt Representation}$  node.

Clicking on the button or on the text "Click Here" opens the window:

### Here

- you edit existing statuses
- add the new statuses
- specify in which direction statuses are to be processed.

The settings in the upper part of the window are the same for all types of display. In the lower third, individual settings for the four different types of display are made.

# **COMMON SETTINGS**

# **STATUS DEFINITION**

Lists all defined statuses. A status can consist of values and status. The element is processed from the first status up to the last entry. The first complete match is shown. Exception: The Overlapping property (for symbols from the library) or Chained (for texts) is active.

Parameters	Description
Default status	The status defined when creating the element. It is always in the first position and can longer be changed or deleted.
Value	Shows the defined (32 bit) value.
Status	shows the defined status. An "F" at the end of the status display indicates a formula.
New	Defines new statuses. in doing so, values, status and formulas of the status currently highlighted are taken on as initial values.
Delete	Deletes the selected status. The default status cannot be deleted.
upwards/downwards	changes the order in which statuses are processed. The default status is always in the first position.

# **FORMULA VARIABLES**

shows all variables that were defined for input in formulas. Existing variables are marked with a green tick, non-existent variables are marked with a red cross. Non-existent variables can be replaced by exiting variables via Change. The Add and Change buttons open the dialog to select variables (on page 238).

# **VALUE**

# Enables

- ▶ input of a value for a status via a matrix or numerically
- ▶ the definition of a formula

Parameters	Description
Value	Defining the value via a preset bit structure
Value	Enter the numeric value.
Formula	Opens the window to enter formulas (on page 83). In the formula variable area, defined variables are available. Linking is performed by logical, bitwise and comparative operators.

# **△** Attention

For non-binary variables, the value is entered in the signal resolution. Settings in the measuring range or the non-linear value adjustment are not supported in this element.

# **STATUS**

Enables status information to be requested.

Attention: Most statuses can only be requested if the driver supports the status processing.

no.	Short term	Long name	Comment
0	M1	User defined status 1	
1	M2	User defined status 2	
2	M3	User defined status 3

# Info

The short terms for the status bits have been unified for all languages since version 6.50. You can find more details and how you can use the old short terms in chapter Status bits - new short terms.

Not acknowledged: If option Flashing is active for the limit of the variable, the bit nor acknowledged is set. With the option Acknowledge flashing also acknowledges alarm in the alarm configuration, the alarm is acknowledged and the bit mot acknowledged is set to 0 (see also chapter Acknowledge flashing for alarms).

# **INDIVIDUAL SETTINGS**

Individual settings for the 4 types of display of statuses is available in the subchapters:

Symbol from Library (on page 71)

Status Text and Screen Symbol (on page 73)

Bitmap and Screen Symbol (on page 75)

Screen Symbol Only (on page 76)

### CONFIGURING THE STATUS FOR VARIABLES THAT HAVE NOT YET BEEN LINKED

Sometimes you must define a combined element but you do not yet have a real, existing variable available. For example, if the combined element is supposed to be used in a symbol of the symbol library and it the variable link will be created only after pulling it into the screen. In this case, you first work with a 'dummy variable', which you then subsequently replace with an existing variable. You can then define all statuses in the combined element if existing variables have not yet been linked. You have no access with dummy variables in the test mode only.

This is how you create a 'dummy' variable:

- ► Enter a symbolic name into the properties of the combined element in the Variable input field.
- ► Click in the Representation area in the Configuration and test field: The page statuses in the element input are opened.
- ▶ In the list of formula variables, existing variables are marked with a green check mark. Variables that do not exist are marked with a red X. You can add further variables:
- Use the Add button for existing variables.
   With Change, you can replace existing and non-existing variables with other variables.
- To add a non-existent variable, click on Add and then on No selection. You get a formula variable named after the following scheme: X00: <empty>. (00 stands for a two-digit number.)
   Highlight the variable and click in the <empty> area; assign a label.
   If you enter the name of an existing variable, the link is established and the mark changes from a red X to a green check mark.

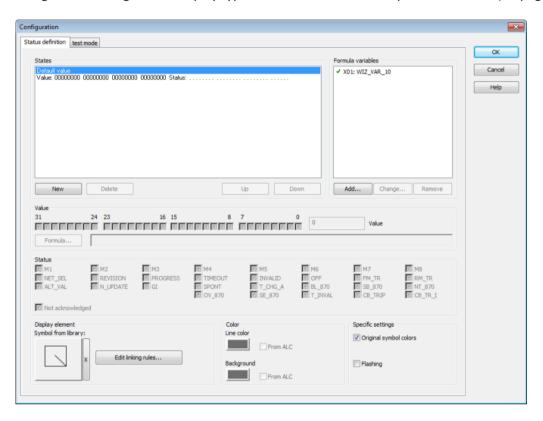

## **FORMULAS**

Read how a formula is created in the chapter on the Formula Editor (on page 77).

# **Symbol from library**

The general settings for all display types can be found in the chapter on statuses (on page 63).

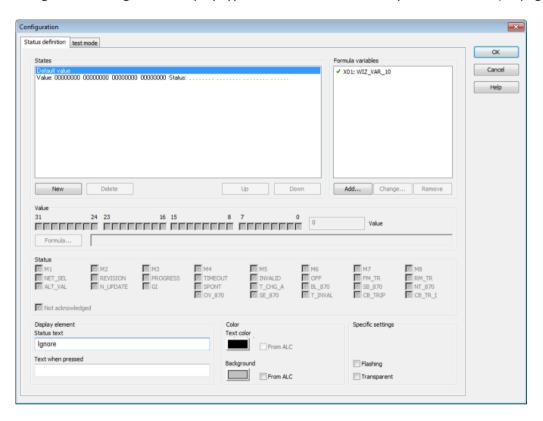

Parameters	Description
Display element	
Symbol from Library	Clicking on the symbol opens the dialog to select a symbol.
	Clicking on the X next to the symbol deletes the selected symbol.
Edit linking rule	Variables and functions contained in the symbol can be exchanged with the help of linking rules.
	<b>Attention:</b> If a variable or function does not fit into the scheme, that link cannot be replaced.
Colors	Only active if the Original Symbol Colors property in Specific Settings is turned off.
Color	Choice of color.
Filling color	Choice of filling color.
From ALC	The color of the linked source is used.
Specific settings	
Original Symbol Colors	Active: Transfers original color from symbol.  Deactivates Take color of main variable property.
Flashing	Active: Symbol flashes in runtime if status has been achieved.

# **Status Text and Screen Symbol**

The general settings for all display types can be found in the chapter on statuses (on page 63).

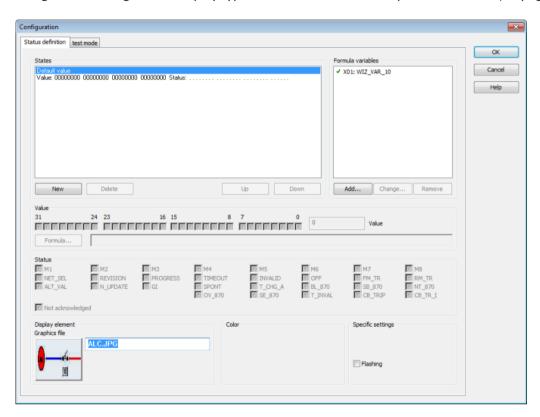

Parameters	Description
Display element	
Status Text	Text for the status.
Text when pressed	Text with pressed Symbol.
Colors	
Color	Choice of color.
Filling color	Choice of filling color.
From ALC	The color of the linked source is used.
Specific settings	
Flashing	Active: Symbol flashes in runtime if status has been achieved.
Transparent	Active: Filling color is set to transparent.

# **Graphic and screen symbol**

The general settings for all display types can be found in the chapter on Statuses (on page 63).

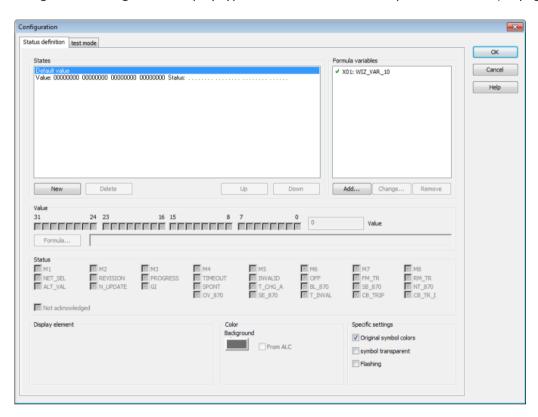

Parameters	Description
Display element	
Graphics	Clicking on Graphics opens the graphics selection dialog.  Delete: Remove name from text line.
Specific settings	
Flashing	Active: Symbol flashes in runtime if status has been achieved.

# **Only Screen Symbol**

The general settings for all display types can be found in the chapter on statuses (on page 63).

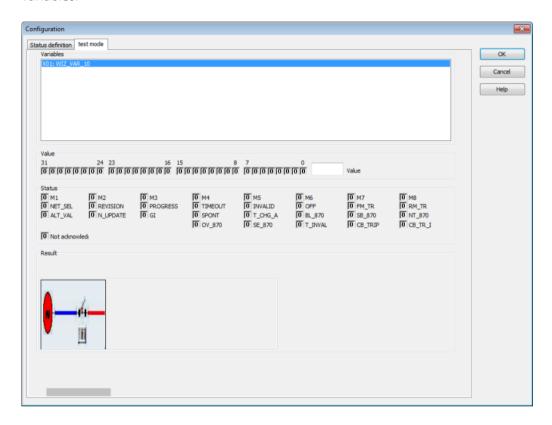

Parameters	Description
Colors	
Color	Choice of color.
From ALC	The color of the linked source is used.
Specific settings	
Original Symbol Colors	Active: Transfers original color from symbol.
Transparent Symbol	Active: Symbol color is set to transparent.
Flashing	Active: Symbol flashes in runtime if status has been achieved.

### 10.7.4 Test mode

The test mode simulates the Runtime: You can test the change of a value and see how your Combined Element would behave during the Runtime. You can only activate this tab if all links refer to existing variables.

Note: In test mode, the symbol is displayed in a lower resolution than on the screen in Runtime .

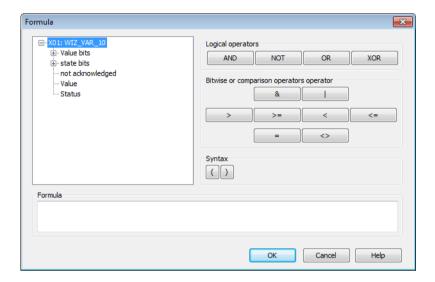

#### 10.7.5 Formula editor

The formula editor provides support when creating formulas with logical or comparative operators with a combined element, for interlockings and commands. If additional variables are required for a formula, create these in the formula variables (on page 63) area of the status window by clicking on the Add button. existing formulas are displayed in the status list with the letters.

## **CREATING A FORMULA**

Click on the Formula button in the status window The formula editor opens

You select the bits for your formula in the left screen.

On the right, you find the operators for logical and comparative operations.

The formula created is displayed in the Formula area.

Up to 99 variables can be linked in one formula. X01 to X99. The length of the formula may not exceed 4096 characters.

## THE MEANING OF THE BITS:

Parameters	Description
value bits	32 value bits (von 0 -31) are available. They describe the variable value bit by bit. For BOOLEAN variables, only bit $0$ is of importance, for SINT and USINT only the bits from $0$ – $7$ , etc.
	<b>Note:</b> The value refers to the raw value (signal range) of the variables and not to the converted measuring range.
status bits	Here you find the most commonly used status bits. You find the exact definition and use of the status bits in the Status Bits List (on page 81).
not acknowledged	Not acknowledged is treated like a usual status bit. But here it is listed separately, because it does not belong to the classical variable statuses.
value and status	In the formulas, all values (value bits and status bits) are treated as binary values and can be logically linked with AND, OR, etc.  The total value and overall status are an exception to this. In order to arrive at a Boolean expression, this total value has to be ORed bitwise with a constant (on page 85). For this, we use the operator &.  For the result 0 (false) of this logical ORing we get the binary value 0 (false), otherwise 1 (true).
	Example: see chapter onbitwise ORing example (on page 85)

The status bits NORM and N\_NORM are only available in the formula editor here. They cannot be engineered using the status.

If other settings outside the formula are set for the current status, they are combined with the formula with a logical AND.

Refer to the examples (on page 87) section for examples.

# Info

Formulas with binary X values and bitwise linking can be used with a maximum of 2 binary values. If more values are required, the linking must be carried out without binary X values.

## Example:

x01.Value & x02.Value -> WOrks

x01.Value & x02.Value & x03.Value -> does not work

But:

x01.00 AND x02.00 AND x03.00 AND x04.00 AND x05.00 -> works

# List of status bits

Bit number	Short term	Long name	zenon Logic label
0	M1	User defined status 1VSB_ST_M1

		I	
47	OV_870	IEC 60870 Status: overflow	_VSB_OV_BIT
48	SE_870	IEC 60870 Status: select	_VSB_SE_BIT
49	T_INVAL	Time invalid	not defined
50	CB_TRIP	Breaker tripping detected	not defined
51	CB_TR_I	Breaker tripping detection inactive	not defined
52	RES52	reserved	not defined
53	RES53	reserved	not defined
54	RES54	reserved	not defined
55	RES55	reserved	not defined
56	RES56	reserved	not defined
57	RES57	reserved	not defined
58	RES58	reserved	not defined
59	RES59	reserved	not defined
60	RES60	reserved	not defined
61	RES61	reserved	not defined
62	RES62	reserved	not defined
63	RES63	reserved	not defined

In formulas all status bits are available. For other use the availability can be reduced.

You can read details on status processing in the Status processing chapter.

# **Logical Operators**

Logical links: Variables will only be checked for the logical value '0'; if the value does not equal '0', it will be considered as '1'.

In contrast to bit formulas, the technical range can be modified by a stretch factor -> (not equal '0' or '1').

Operator	Meaning
AND	logical 'AND'
NOT	Negation
OR	logical 'OR'
XOR	logical 'EXCLUSIVE OR'

The operators have the following priority in the formula calculation:

Priority	Operator
1	& (operator for bit formulas (on page 84))
2	NOT
3	AND
4	XOR/OR

Up to 99 variables can be linked in one formula. X01 to X99.

# Info

The status bits NORM and N\_NORM are only available in the formula editor here. They cannot be engineered using the status.

### Bit formulas

Bit formulas only have a logical high or low state. In contrast to logical formulas, the raw value is already predefined (0,1).

Operator	Description
&	AND
I	OR

#### **Example oring bit for bit**

You want to find out if one of the user status bits 1-8 (M1 ... M8) of the variable X01 is set.

#### **USUAL FORMULA:**

x01.M1 OR x01.M2 OR x01.M3 OR x01.M4 OR x01.M5 OR x01.M6 OR x01.M7 OR x01.M8 This request can be made much easier by using the logical ORing of the (complete) status.

#### **LOGICAL ORING:**

X01.Status & 0xFF

The constant can be entered in hexadecimals, as described above:

 $0 \times FF$  corresponds to decimal 256; these are the first eight status bits (binary 11111111). If one of these bit is set to 1, the result of this bitwise ORing is 1 (true), otherwise it is 0 (false).

If, for example, all user status bits except the user status bit M7 should be queried, the binary statement for this would be: 10111111. Bit 7 is not of interest and is thus set to 0. This corresponds to 0xBF in hexadecimal. The expression for the formula is then: x01.Status & 0xBF.

Instead of ORing bitwise with a constant, the value can also be directly compared to a decimal number. If the comparison is wrong, the binary value is 0 (false) otherwise it is 1 (true).

### Example:

You want to find out if the value is equal to the constant 202: The formula is:

X01.value = 202

If the value is equal to the constant 202, the result of the comparison is 1 (true) otherwise it is 0 (false).

**Note:** The bitwise ORing works with the OR character (1) in a similar manner to this example.

### **Comparative operators**

Comparison operators serve for the direct comparison of two numeric values. The result of this comparison is a binary value. "0" if the condition is not fulfilled and "1" if the condition is fulfilled.

Operator	Description
<	smaller
>	greater
<=	Lower or equal
>=	greater or equal
=	Equal
<>	unequal

To the left and to the right of the comparison operator, there has to be a (total) value or a (total) status, single bits cannot be used with these comparison operators.

There can also be a constant to the right of the comparison operator. (the constants can only be integers; a comparison to a floating point number is not possible.)

These constants are entered as hexadecimal values or decimal values in the combined element. Hexadecimal figures are automatically converted to decimal values by clicking on ox (for example, 0x64 is in decimal figures 100).

X01.value >= X02.value

The result is 1, if the value of X01 is higher than or equal to the value of X02

X01.value = 0x64

The result is 1, if the value of X01 is exactly equal to the numeric value 100 (= hex 0x64)

(X01.value = 0x64) OR (X01.value = 0x65)

The result is 1, if the value of X01 is exactly equal to the numeric value 100 or 101 (= hex 0x64 and hex 0x65)

### **Example for formulas**

#### SIMPLE LOGICAL AND LINKING BETWEEN TWO BIT VALUES

Formula: X01.03 AND X02.03

This formula has the status TRUE, if both bit 3 of variable 1 and bit 3 of variable 2 both have the value 1.

#### COMPARISON OF AN ANALOGUE VALUE OR STATUS OF A VARIABLE

(X01.Value> X02.Value)

#### COMPARE ANALOG VALUES WITH EACH OTHER ON A LOGICAL BASIS

(X01.Value> X02.Value) AND (X01.Value = X02.Value)

#### **COMPARE WITH VALUE BITS AND STATUS BITS**

(X01.Value> X02.Value) AND (X01.Value = X02.Value) OR (X01.03 = X02.03)

#### COMPARE A VALUE WITH A DECIMAL OR HEXADECIMAL VALUE

Formula: (X01.Value = 111)

Formula: (X01.Value = 0x6F)

If a hexadecimal values is used, this is later transferred to decimal by clicking on ox. If a decimal value is entered and confirmed, the value continues to be displayed as a decimal value after reopening.

It is not possible to use a comma or a period when entering values.

# 10.7.6 Display of variable name and variable identification

You can display variable names and identifications with the the help of the combined element. Proceed in the following way:

- 1. Create a combined element.
- 2. As type of display, select Status text & screen symbol.
- 3. Create a default state.
- 4. Enter the following placeholder as status text

fill-in	Description
%n	shows the variable name
%n,1,2	shows the variable name starting at position 1 for 2 characters
%N	shows the variable name
%N,3,2	Shows the variable name minus the first 3 and the last 2 characters
%l	shows the variable identification
%1,1,2	shows the variable identification starting at position 1 for 2 characters
%L	shows the variable identification
%L.3.2	Shows the variable identification minus the first 3 and the last 2 characters

# 10.8 Combo/List Box

You link values of variables with texts using the Combo/List boxes dynamic element. You use this in two ways:

- 1. If a text is selected in runtime, the value of the variable changes to the value that is linked to this text.
- 2. If the value reaches the value of the defined value, the linked text is displayed in the combo/list box with the current value.

### **CREATE A COMBO/LIST BOX**

To create the combo/List box dynamic element in a screen:

- select the Combo/List box symbol in the Elements tool bar or in the Elements drop-down list
- select the start point in the main window
- 3. pull open the element while pressing and holding the left mouse button
- 4. a Dialog (on page 238) opens in which you can link the desired variable to the element. The following variable types are supported:
  - **Binary**
  - Numerical
  - string

# 💡 Info

Variables can also be linked to the element by Drag&Drop. Drag a variable onto a combo/list box and this then replaces the variables that were there before.

The combo/list box element supports the same additional functionalities as the numerical value (on page 191) element:

- Lock, Status, Visibility, Dynamic Colors.
- Dynamic colors: The background color is only accepted for existing entries. The part of the element that is not filled with entries is displayed in the standard background color.

Linking of macros to element events (such as LeftClickUp ...) is not supported.

## Attention

It is not possible to modify colors and fonts in the combo/list box under Windows CE.

Comboboxes/listboxes can be created dynamically or statically. The ID\_PROP\_COMBOLIST\_DYNCONTENT\_USE property switches between static and dynamic operation. Fixed entries are defined in the Editor during static operation. In dynamic operation, a content variable is linked and its value is interpreted in Runtime.

### **DIFFERENCE BETWEEN COMBOBOX AND LIST BOX**

The texts are opened individually in a window in the combo box.

The values are displayed in a list and the current value is marked in the List box. If there are more statuses than can be displayed in the list, a scroll bar is displayed.

If the variable has a value which has not been defined in the combo box/list box entries, no text is displayed or marked.

#### STATIC COMBOBOX OR LIST BOX

Fixed entries are configured in the Editor for a static box. These are displayed and used in Runtime.

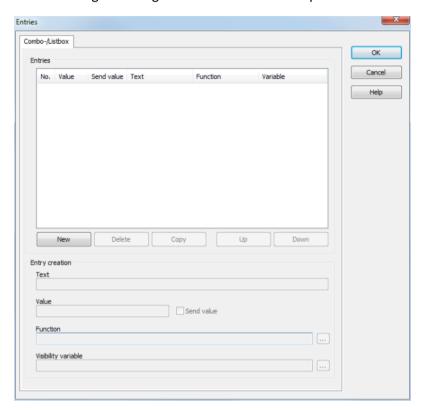

To enter values:

- 1. Open the Representation group.
- 2. Select the display type using the Type property: Combobox or List box.

Default value Listbox

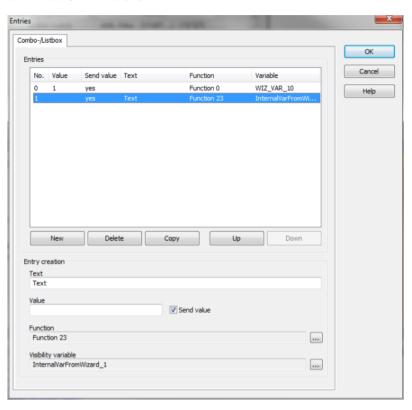

- 3. Deactivate the Entries from string variable property
- 4. Click on the ... button in the Entries property
- 5. The dialog for configuration of the entries is opened

- 6. enter the values for statuses
- 7. Link the values with the texts for statuses

# **ENTRIES DIALOG**

Parameters	Description	
Entries	List of entries already defined.	
no.	Consecutive number, is assigned automatically.	
Value	Value that was assigned under Entries/Value.	
Send value	Yes: Send value is active.	
	No: Send value is inactive.	
Text	Character string that was entered intoEntries/Text .	
Function	Function that was linked to the Entries/Function field.	
Variable	Linked visibility variable.	
New	Creates a new entry with:	
	consecutive number	
	▶ Set active value	
Delete	Removes the selected entry. Only one entry can be removed; it is not possible to select several entries.	
Сору	Copies selected element and adds it at the end of the list as new element.  The settings of the copied elements are taken over.	
Upwards/downwards	Moves the selected entry upwards or downwards and adapts the consecutive numbering to suit.	
Entry setting	Configuration of entries in the list.	
Text	Entry of the character string which is linked to the value.	
Value	Numerical value.	
	The values that can be entered depends on the data type of the variables.	
Send value	activates or deactivates set value:	
	Active: The value is set as a set value. Inactive: The value entered only serves to index the selection. Attention: Set value only affects the value, not the function. The function is always sent. The Set active value must be inactive for a value without linked variable!	

Function	Function that is executed when the entry is selected in Runtime. Click on the button to open the dialog for selecting a function (on page 237).  Attention: The function is only executed if you select the entry via the combo box/list box during runtime. If the triggering value changes and reaches the level of the variable, the function is not executed. Set value must be inactive for a function call without linked variable.
Visibility variable	Variables for which the value changes and thus limit violations can be evaluated in Runtime. If there is a limit breach of the visibility variables, the Visibility property is evaluated by this limit breach. It determines if the entry is visible in the list or not. The entry is displayed in the list as standard (there is no limit breach). Click on the button to open the dialog for selecting a variable (on page 238).  Attention: A value change during operation can lead to, with comboboxes, an open combobox being closed.
OK	Applies settings and closes dialog.
Cancel	Discards changes and closes dialog.
Help	Opens online help.

### **SORTING ENTRIES**

The entries can be sorted using:

- ▶ Upwards and Downwards buttons: Highlight the desired element and move it with the buttons.
- ▶ Drag & drop: Drag the element to the desired place with the mouse. A red line displays the point where the element is inserted.

### **DYNAMIC COMBOBOX OR LIST BOX**

For dynamic operation, a string variable that defines the content must be linked using the Variable property. Any static entries that may be configured at the same time in Runtime are ignored. The value of the content variable is evaluated and interpreted. To do this, the value of the variables must correspond to a valid layout in Runtime.

#### **LAYOUT**

The string value displays a list of entries. Each entry consists of a value and a text that is separated with a comma ",". Entries are concluded with a semi-colon ";". If the text part of an entry contains an "@" character, the text part is translated with the help of the existing language table.

Example of a valid string value:

```
1, one; 2, two; 3, three;
```

Example of a valid string value with translation:

```
1,@one;2,@two;3,@three;
```

#### CONFIGURATION

To link a variable:

- 1. Open the Representation group.
- 2. Select the display type using the Type property: Combobox or List box.

Default value Listbox

- 3. Activate the Entries from string variable property
- Select, using the Variable property, the desired variable
   (clicking on the ... button opens the dialog for variable selection (on page 238))
- 5. Select the string variable with the configured entries

#### MARK ELEMENT IN LIST WHEN SELECTED

The elements displayed in the combo box or list box can be marked in color in runtime. To do this:

- navigate to Group Color in properties
- ▶ select Properties in the group Colors static
  - Text color when selected for the text color
  - Background color for selected entry for the text background color

These colors are then used during runtime. Operating system settings are ignored, as are the colors of linked variables.

# Info

The colors of the operating system were used up to version 6.50. When converting the project:

- the background color is set to that configured in the operating system
- if the text color is set as a statically defined color

On computers where the colors have been changed in the operating system, this may lead to different behavior during runtime.

#### **TROUBLESHOOTING**

Errors are displayed as log entries in the Diagnosis Server:

Message	Level	Meaning
The value '%s' of the content variable '%s' is not valid, entries might be incorrect or missing!	Error	The string variable linked in the Variable property has a value with invalid layout.  The text is evaluated as far as possible. The current value is also logged to make error analysis in Runtime easier.

#### **Dynamic Text** 10.9

With the Dynamic Text dynamic element, you display the current limit value text in the event of the limit being breached or display the value of a string variable in alphanumeric form. If there is no limit violation, the text defined in the Editor is displayed.

To create a dynamic text in a screen:

- 1. select the Dynamic Text Symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window
- pull open the element while pressing and holding the left mouse button 3.
- 4. the dialog to assign a variable (on page 238) opens
- 5. select the variable you want to assign

6. Define the desired properties in the properties window

# 10.10 Ellipse

### To draw an ellipse:

- select the Ellipse/Circle symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window
- 3. pull open the ellipse while pressing and holding the left mouse button
- 4. The shape, size and position can be changed at any time by pulling the vertexes or moving the element
- 5. if you press and hold alt while pulling the outer corner points, the change is carried out symmetrically
- 6. define the desired properties in the properties window

## **10.11** Circle

In order to draw a circle:

- 1. select the Ellipse/Circle symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window
- 3. hold down the shift key
- 4. pull open the circle while pressing and holding the left mouse button
- 5. The shape, size and position can be changed at any time by pulling the vertexes or moving the element
- 6. if you press and hold alt while pulling the outer corner points, the change is carried out symmetrically

- 7. if you want the circle to retain its shape press and hold Shift while pulling
- 8. define the desired properties in the Properties window

## 10.12 Arc of a circle

In order to draw an arc of a circle:

- select the Arc of Circle symbol in the Elements tool bar or in the Elements drop-down list
- select the start point in the main window
- pull open the arc of the circle while pressing and holding the left mouse button
- pulling upwards to the right opens the arc of the circle to the left; all directions work along the same lines
- to change the opening direction, move a central touch point over the opposite line
- The shape, size and position can be changed at any time by pulling the vertexes or moving the element
- if you press and hold alt while pulling the outer corner points, the change is carried out symmetrically
- hold down the shift key whilst moving it and the aspect ratio is maintained
- define the desired properties in the properties window

# Info

The arc of the circle is always displayed as a quadrant and can be extended by copying and pasting.

Filling patterns and filling colors are not available for arcs of circles.

# 10.13 Segment of a circle

#### Attention

With the segment of a circle, you draw the desired part of a circle or ellipse.

To draw a segment of a circle:

- 1. Select the Segment of Circle symbol in the Elements tool bar or in the Elements drop-down list
- select the start point in the main window
- 3. pull on the segment of the circle pressing and holding the left mouse button
- pulling upwards to the right opens the segment to the left and vice versa
- 5. to change the opening direction, move a central touch point over the opposite line
- 6. The shape, size and position can be changed at any time by pulling the vertexes or moving the element
- 7. if you press and hold Alt while pulling the outer corner points, the change is carried out symmetrically
- 8. hold down the shift key whilst moving it and the aspect ratio is maintained
- 9. you have two possibilities to change the opening angle or to open the circle segment upwards or downwards:
  - move the mouse over one of the two divided touch points until the mouse pointer on the outermost of the two points turns into a black cross with arrows and move the point into the desired direction

or

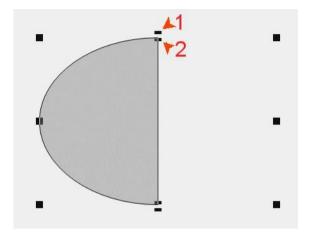

- Change the angle settings properties under Opening angle. e.g.:
  - for opening downwards: End angle [°] 180° and Start angle [°] to 0°
  - for opening downwards: the reverse of the above

Angle data can have a maximum of two decimal points.

Note: Because the corner points calculated from angle data are pixels, and these must be whole numbers, it can be the case that the angle display deviates from the data somewhat. For example 45° does not give whole number of pixels. It is rounded off internally in zenon and the the angle is displayed as 44.75°.

10. define the desired properties in the Properties window

Key:

- 1) touch points for opening angle
- 2) touch point for height

If you would like to use the segment of a circle as an arc of a circle, change the Filling pattern property to the value of transparent. Only the outer line is

displayed with the transparent display type.

The opening angle must always be  $> 0^{\circ}$  and  $< 360^{\circ}$ .

#### **Attention**

The Segment of a circle element is not available in Windows CE.

## 10.14 Line

To draw a line:

- 1. select the Line symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window
- 3. pull out the line while pressing and holding the left mouse button
- 4. The shape, size and position can be changed at any time by pulling the vertexes or moving the element
- 5. if you press and hold alt while pulling the outer corner points, the change is carried out symmetrically
- 6. define the desired properties in the properties window

Info

Filling patterns and filling colors are not available for lines.

# 10.15 Message element

With the Message Element dynamic element, you can show text in runtime depending on the statuses of process variables. The source for texts are ASCII text files, made up as tables. You can configure these freely.

To create the Message Element in a screen:

- 1. select the Message Element symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window
- 3. pull open the element while pressing and holding the left mouse button
- 4. the dialog to Assign a variable (on page 238) opens
- 5. select the desired variables
- 6. Define the desired properties in the properties window

#### **CONSTRUCTION OF THE TABLE**

- ► Create an **ASCII** text document
- you must save it in Unicode format
- ▶ use the character | (ASCII-Code 124) as a column separator
- Example:
- 1 | Off | On | Diff | Fault
- 2 |Off | On | True | False
- 4 | Text1 | Text2 | Text3 | Text4
- ▶ the linked variables define lines and columns of the text to be shown

### FIRST VARIABLE

The first variable in the list must be a word variable and defines the column position from which the text is taken. At the same time, it controls the type of processing.

bit set	effect
Bit 15 (bit with the highest value	Message element blocked; nothing is displayed any more.
Bit 14	Update of the screen output switched off; last active text is displayed.

**Note:** For a 16-bit variable a maximum of 14 columns is possible. The addressing of the column takes place via the bit number and not via the analog value.

### **SECOND AND FURTHER VARIABLES**

The other variables define the line position from which the text is taken. The significance arises from

Value	Row
1	Line 1
2	Line 2
4	Line 3

Each line variable is responsible for a maximum of 16 lines. If more than 16 lines are needed, further line variables can be defined.

If line 1 and line 2 are to be displayed alternately, the significance of the line variable must be 3. If all 16 bits are set, lines 1 to line 16 are displayed alternately.

# 10.16 Multi-binary Element

You can define several elements with the Multi-binary dynamic element:

- display graphics depending on variable values
- Color symbols
- Issue status text
- ▶ link numerical values and binary values
- display a switch or key for the first variable, provided the first variable is a binary variable

#### **CREATE THE MULTI BINARY ELEMENT**

To create a multi-binary in a screen:

- 1. select the Multi-binary symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window
- 3. pull open the element while pressing and holding the left mouse button
- 4. the dialog to Assign a variable (on page 238) opens
- 5. select the desired variables
- 6. Define the desired properties in the properties window

### **DEFINE STATUSES**

You define the settings for variable statuses to be displayed in the dialog to enter elements:

- 1. click on the Representation node
- 2. on the Configuration property
- 3. the dialog for status definition (on page 104) opens

- 4. defined statuses are processed from top to bottom
- 5. The settings for the first applicable status are displayed

# 10.16.1 Multi-binary element

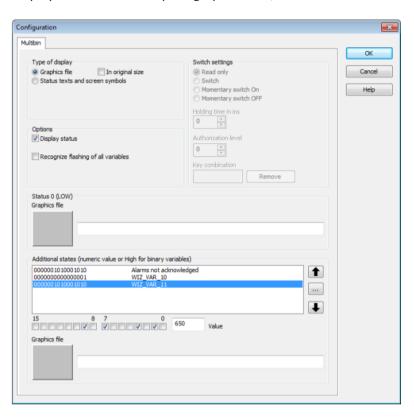

To assign the multi binary element to certain statuses:

- 1. click on the Representation node
- 2. on the Configuration property
- 3. the dialog for inputting elements (on page 104) opens
- 4. select the desired display type:
  - Graphics: Representation of the information in pixel graphics files; this also enables moved screens
  - Screen symbol/status text: Display of symbols and text information
- 5. Defined statuses processed from top to bottom and the setting for the first applicable status are displayed.

# Graphic

Display of information in pixel graphics files; this also enables moved screens.

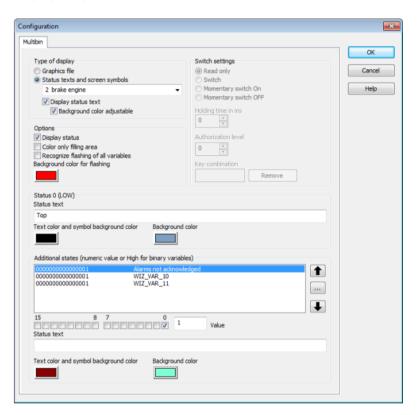

Property	Description
In original size	Active: Graphics are displayed in original size.
	Inactive: Graphics are stretched or compressed to the display size.
Options	
Display status	Highlights the element in runtime with a red dot at exception status.
Recognize flashing of all variables	Active: Sum alarming of all linked process variables. The graphics or color are determined by the current status. Active flashing states remain kept until quitting.
Status 0 (LOW)	Settings for the current status in line with display type.
Graphics	<ul> <li>Selection of graphics. A click on the button opens the file selection dialog.</li> <li>To select a file from a project, this must already be present in the Files/graphics node in the project manager.</li> <li>to select a file directly from any desired folder on the computer, the Direct file selection property must be activated.</li> </ul>
Further statuses	Select further variables (on page 238) via the button and sorting of statuses via the <code>Upwards</code> and <code>Downwards</code> buttons.  For each of the linked variables, there must be a discrete status defined; this is defined by entering the values for multibit information and numerical values. Multibit values must be assigned several times: Number of statuses minus 1; example double message=3.  If a discrete state has occurred, it is displayed. If none of the indicated values is present, the status 0 [LOW], globally valid for the element, is displayed.  Note: for non-binary variables, the value is entered in the signal resolution.

# Screen symbol/status text

Display of symbols and text information. The color of the current status is given at the same time.

Property	Description
Screen symbol/ Status text	Select a symbol. The symbol must already be present on the screen The symbol shown in the drop-down list flashes on the screen until the Enter element dialog is ended.
Display status text	Active: Status texts are displayed in runtime.
Background color can be set	Active: The background color for the text can be freely chosen.
Options	
Display status	Highlights the element in runtime with a red dot at exception status.
Only color the filling color	only the filling area of the static elements is colored, the border stays the same
Recognize flashing of all variables	Active: Sum alarming of all linked process variables. The graphics or color are determined by the current status. Active flashing states are maintained until quitting.
Background color when flashing	Background color when flashing
Status 0 (Low)	
Status text	Text that it is displayed in runtime. Input is only possible if the Display status text property is active.
Symbol color/text color	Select the color for the symbol and status text.
Text background color	Selection of the background color for the status text. Only available if the configurable background property is active.
Further statuses	Select further variables (on page 238) via the button and sorting of statuses via the Upwards and Downwards buttons.
	For each of the linked variables, there must be a discrete status defined; this is defined by entering the values for multibit information and numerical values. Multibit values must be assigned several times:  Number of statuses minus 1; example double message=3.  If a discrete state has occurred, it is displayed. If none of the indicated
	values is present, the status 0 [LOW], globally valid for the element, is

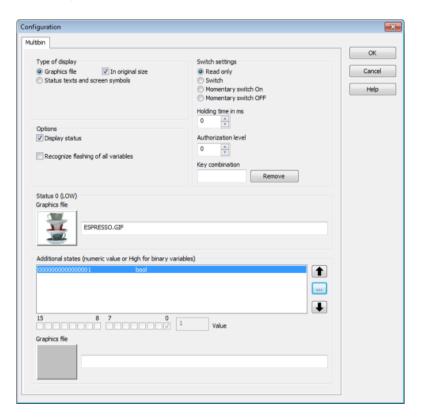

displayed.

Note: for non-binary variables, the value is entered in the signal resolution.

## **Switch settings**

If a binary variable is linked as the first variable, this can be used as a switch or momentary switch.

Property	Description
Read only	It is not possible to input setpoints in runtime.
Switch	Element acts as a switch for setpoint input.
Key ON	Writes setpoint HIGH. The preferred position for the switch goes to Off.
Key OFF	Writes setpoint LOW. The preferred position for the switch goes to On.
Holding time in ms	Holding time of target state
Authorization groups	Defines the necessary authorization level for set value element.
Key combinations	Key combination for set value input

## 10.17 Polygon

#### To draw a polygon:

- 1. select the Polygon symbol in the Elements tool bar or in the Elements drop-down list
- 2. In the main window, select the start point by clicking the left mouse button
- 3. pull the first section
- 4. place an initial corner point with a simple mouse click (left)
- 5. draw another line and place the corner points
- 6. set the end point by double clicking or pressing the escape key
- 7. The shape, size and position can be changed at any time by pulling the vertexes or moving the element
- 8. hold down the shift key when pulling; this way, only horizontal or vertical movements away from the original position are possible
- 9. define the desired properties in the Properties window

Hint: You define the rounding (on page 195) of the lines with the Rounding property. To do this, select a value between 0 (no rounding) and 1 (maximum rounding).

#### **ADDING CORNERS:**

To add corners (corner points):

- move the mouse cursor to a line of the polygon:
- right-click
- ▶ select menu item Adding a node in the selected element from the context menu

or:

- ▶ press Ctrl and Shift simultaneously
- ▶ move the mouse cursor to a line of the polygon:
- ▶ the mouse cursor changes to an arrow with a plus-symbol
- ▶ left-click in order to add a corner

#### **REMOVING CORNERS:**

- move the mouse cursor to a corner of the polygon:
- right-click
- ▶ select menu item Deleting the node in the selected element from the context menu

or:

- ▶ press Ctrl and Shift simultaneously
- ▶ move the mouse cursor to a corner of the polygon:
- ▶ the mouse cursor changes to an arrow with a plus-symbol
- ► left-click to delete the corner

The With brightness values property is not available for polygons.

## 10.18 Polyline

#### To draw a polyline:

- 1. select the Polyline symbol in the Elements tool bar or in the Elements drop-down list
- 2. In the main window, select the start point by clicking the left mouse button
- 3. pull the first section
- 4. place an initial corner point with a simple mouse click (left)
- 5. draw another line and place the corner points
- 6. set the end point by double clicking or pressing the escape key
- 7. The shape, size and position can be changed at any time by pulling the vertexes or moving the element
- 8. hold down the shift key when pulling; this way, only horizontal or vertical movements away from the original position are possible
- 9. define the desired properties in the Properties window

Hint: You define the rounding (on page 195) of the lines with the Rounding property. To do this, select a value between 0 (no rounding) and 1.

#### **ADDING CORNERS:**

To add corners (corner points):

- move the mouse cursor to a line of the polygon:
- right-click
- select menu item Adding a node in the selected element from the context menu

or:

- press Ctrl and Shift simultaneously
- move the mouse cursor to a line of the polygon:
- the mouse cursor changes to an arrow with a plus-symbol

left-click in order to add a corner

#### **REMOVING CORNERS:**

- move the mouse cursor to a corner of the polygon:
- right-click
- select menu item Deleting the node in the selected element from the context menu

or:

- press Ctrl and Shift simultaneously
- move the mouse cursor to a corner of the polygon:
- the mouse cursor changes to an arrow with a plus-symbol
- left-click to delete the corner

## Attention

If you make a Polyline into a polygon, the touch points for the start and end of the line are invisible where they overlap if the invert background option is activated. You deactivate this option under Option Menu-> Settings-> Corner Points-> Invert Background.

## 10.19 Rectangle

To draw a rectangle:

- 1. select the Rectangle symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window
- 3. drag the rectangle while pressing and holding the left mouse button
- 4. The shape, size and position can be changed at any time by pulling the vertexes or moving the element

- 5. if you press and hold alt while pulling the outer corner points, the change is carried out symmetrically
- 6. define the desired properties in the properties window

Hint: You can round (on page 195) the corners at will in order to created a rectangle with rounded corners

## **10.20** Square

In order to draw a square:

- 1. select the Rectangle symbol in the Elements tool bar or in the Elements drop-down list
- 2. hold down the shift key
- 3. select the start point in the main window
- 4. pull open the square while pressing and holding the left mouse button
- 5. The shape, size and position can be changed at any time by pulling on the corner points or moving the element;
  - if the 'square' shape is to be retained hold down the shift key whilst pulling on the corner points
- 6. if you press and hold alt while pulling the outer corner points, the change is carried out symmetrically
- 7. define the desired properties in the properties window

## 10.21 Tube

To draw a tube:

- 1. select the Tube symbol in the Elements tool bar or in the Elements drop-down list
- 2. In the main window, select the start point by clicking the left mouse button
- 3. pull the first section

- 4. place an initial corner point with a simple mouse click (left)
- 5. draw another line and place the corner points
- 6. set the end point by double clicking or pressing the esc key
- 7. The shape, size and position can be changed at any time by pulling the vertexes or moving the element
- 8. hold down the shift key when pulling; this way, only horizontal or vertical movements away from the original position are possible
- 9. define the desired properties in the Properties window

Hint: You define the rounding (on page 195) of the lines with the Rounding property. To do this, select a value between 0 (no rounding) and 1 (maximum rounding).

#### **ADDING CORNERS:**

To add corners (corner points):

- ▶ move the mouse cursor to a line of the polygon:
- right-click
- ▶ select menu item Adding a node in the selected element from the context menu

or:

- press Ctrl and Shift simultaneously
- ▶ move the mouse cursor to a line of the polygon:
- ▶ the mouse cursor changes to an arrow with a plus-symbol
- left-click in order to add a corner

#### **REMOVING CORNERS:**

- ▶ move the mouse cursor to a corner of the polygon:
- right-click
- ▶ select menuitem Deleting the node in the selected element from the context menu

or:

- ▶ press Ctrl and Shift simultaneously
- ▶ move the mouse cursor to a corner of the polygon:
- ▶ the mouse cursor changes to an arrow with a plus-symbol
- left-click to delete the corner

## **10.22** Switch

You show the value of a binary variable in graphic form and modify it with the switch dynamic element. The element can also be used as a switch for one-stage unsecured command input.

To create switch in a screen:

- select the switch symbol in the Elements tool bar or in the Dynamic Elements drop-down list
- select the start point in the main window
- ▶ pull open the element while pressing and holding the left mouse button
- ▶ the dialog to select a binary variable (on page 238) opens
- select the variable you want to assign
- define the desired properties in the properties window

To use the element as a switch, activate the Momentary switch property in the Write set value node

#### 10.23 Static Text

To enter statistical text:

- select the Statistical Text symbol in the Elements tool bar or in the Elements dropdown list
- 2. select the start point in the main window
- 3. pull the text field open while pressing and holding the left mouse button

- 4. The shape, size and position can be changed at any time by pulling the vertexes or moving the element
- 5. if you press and hold the alt key while pulling the outer corner points, the change is carried out symmetrically
- 6. define the desired properties in the Properties window

#### To enter text:

1. click on the text field with a delayed double click

or: select Edit in the context menu

2. write the desired text

## 💡 Info

The text is automatically wrapped as standard, depending on the size of the text field. To turn off the wrapping, deactivate the property Word wrap in the Representation node.

Hint: If a Text angle [°] (Representation) is defined in the property, it is not possible to wrap the text. An angle display with text wrapping can also be achieved by rotating the whole element (including the frame lines, if activated).

#### UNDERLINE

To underline text, place a & in front of the text to be underlined.

&Text becomes:

If you would like to use the character '&' in text, enter it twice: 1 && 2 becomes 1 & 2.

#### **LINE BREAK**

To define a line break, use the string \n.

Example:

Line 1 \n

Line 2

Info

Input is no longer limited to 80 characters from version 6.51 onwards.

## 10.24 Move symbol (up to version 6.22 only)

With the Move Symbol dynamic element, you can move elements you wish to move horizontally or vertically or change their size (zoom) regardless of the status of other variables. To do this, connect the elements to a symbol.

To create Move Symbol in a screen:

- select the Move Symbol symbol in the Elements tool bar or in the Elements drop-down list
- select the start point in the main window
- pull open the element while pressing and holding the left mouse button
- select the desired variable and define the desired properties in the properties window
- ▶ You can only use symbols that are already in the screen

The Move Symbol dynamic element is available up to version 6.22. From version 6.50, use dynamic properties of an element such as Position, Size and rotation dynamic or Color for all dynamic actions.

## 10.25 Trend Element

With the Trend Element dynamic element, you display all values in runtime in the form of trend curves, where several process variables can be displayed at the same time.

In order for the Trend Element to display values, the Harddisk data storage active property in the Harddisk data storage node of variable properties must be active. Cycle time [s] and Number of values must concur with Update time and the Time of representation

in Trend Element, otherwise the screen to draw curve will be restarted each time it is shown. Each change can have an effect on other Trend Elements that use the same process variables.

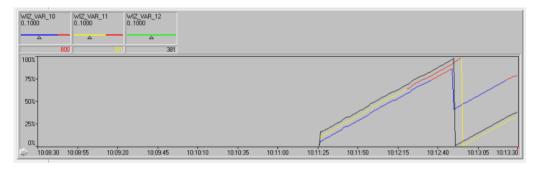

#### **CREATE A TREND ELEMENT**

To create a Trend Element in a screen:

- 1. Select the Trend Element symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window
- 3. pull open the element while pressing and holding the left mouse button
- 4. the dialog to assign several numeric variables (on page 238) opens
- 5. select the desired variables
- 6. all curves are automatically created in the Trend Element

To add a curve later:

- In properties, select the {Curve new} property in the Curves node
   or:
- drag the desired variable onto the Trend-Element while holding the left mouse button
- 7. Define the desired properties in the properties window
  - You define Graphic properties of the curves in the Curves node of properties
  - You determine cycle time and number of values in the properties of the respective variable in the Harddisk data storage node

Functions and variables can also be linked to the Element by Drag&Drop.

## 10.26 Clock

With the Clock dynamic element, you show the current time in Runtime or you convert numerical values into a time. The date/and or the time can be displayed as an absolute time or a time difference.

#### **ADVERTISEMENT**

The display in Runtime depends on whether a variable was linked.

- If no variable is linked to the element, the current system time is displayed in absolute time in Runtime.
  - To do this, set, in the Representation group, the Type of display property to the value System time/absolute time.
- ▶ If a variable is linked, then its value can be displayed as:
  - Time difference: The variable must contain the number of seconds.

    The integer values in the seconds area -2147483648 (min(DINT)) to +
    4294967295 (max(UDINT)) can be displayed.

    It is therefore also possible to display negative values: A variable value of -60 is
    displayed in mm:ss format as -01:00. Thus if -01:40 is this displayed, the
    resulting variable value is -100.
  - Absolute time: The Unix time the seconds passed since January 1, 1970 00:00
     UTC in the positive range.

Only positive values up to 2147483647 can be displayed. A variable value outside this area leads to an incorrect display: The hh:mm part remains 00:00 or 01:00 in winter time.

#### **CONFIGURATION**

To create a clock in a screen:

- 1. select the clock symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window

- 3. pull open the element while pressing and holding the left mouse button
- 4. If a variable is to be linked, then:

Link the desired variable in the Variable / function section or by dragging & dropping the element

- All variables can be linked, with the exception of string and Boolean variables
- Fractions of float variables (from data types REAL and DATA\_AND\_TIME for example) are not taken into account.
- 5. Define the desired properties in the properties window, most of all:
- 6. Select the Type of display property in the Representation group
  - System time/absolute time: The time is displayed as an absolute time. Note: Context menu and tooltip are not supported.
  - Time difference: The time difference is given in minutes and seconds The linked variable must contain the number of seconds.

The integer values in the seconds area -2147483648 (min (DINT)) to + 4294967295 (max (UDINT)) can be displayed. It is therefore also possible to display negative values.

Examples in mm: ss format: The variable value 50 is displayed as 00:50, the variable value 100 is displayed as 01:40.

The variable value -60 is displayed as -01:00. Thus if -01:40 is this displayed, the resulting variable value is -100.

7. Select the desired display using the Formating property

## Info

With absolute time with the Write set value via element, the input field has time difference formatting.

For example:

- Absolute time formatting: hh:mm:ss dd.mm.yy is displayed in the element as: dd:hh:mm:ss
- dd.mm.yyyy (for example 17.12.2008) as ddddd (14230 days since 1. 1. 1970).

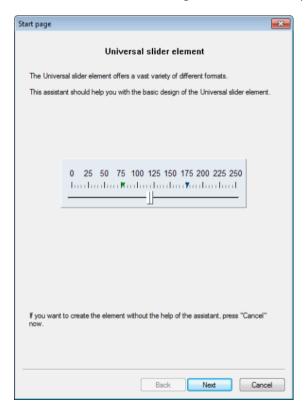

## 10.27 Universal slider

With the Universal slider element, you show variables in the form of sliders, bar graphs, LED bar displays or any other sliders you wish. The sliders allow set value elements to be set in runtime.

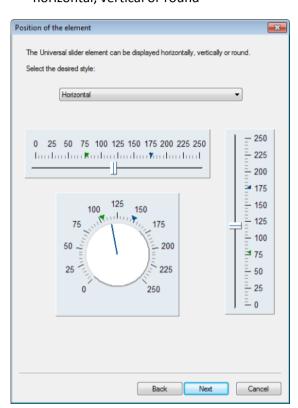

To create the universal slider in a screen:

- 1. select the Universal Slider Symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window
- 3. pull open the element while pressing and holding the left mouse button
- 4. the dialog to assign a variable (on page 238) opens
- 5. select the variable you want to assign
- 6. the universal slider configuration assistant opens

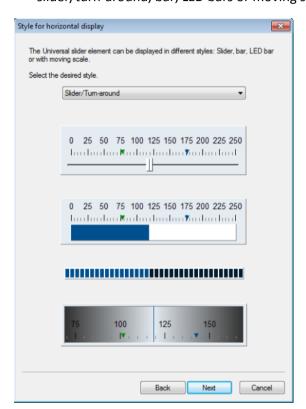

# 7. select the alignment: horizontal, vertical or round

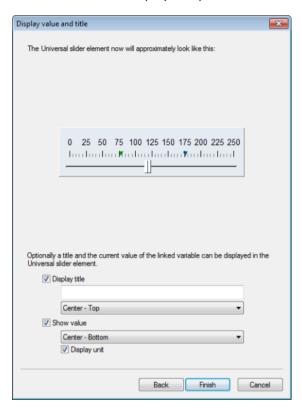

8. select the shape: slider/turn-around, bar, LED bars or moving scale

9. You a given a preview:

Define the title display and position of the value display.

10. You define other properties in the properties window

Hint: You change the display and shape of a universal slider in properties in the Universal slider node

A drag indicator can display the minimum or maximum value of the variables within a certain period of time. Double-clicking the element in runtime resets the marking of minimum and maximum.

## **COLOR-CODED DISPLAY OF THE LIMIT VIOLATION**

At limit violations the color from the variable can color the whole area or only the area starting from the limit violation. This functionality is controlled via property <code>Bar explicitin group Universal slider</code>.

This property affects only the display of values with defined limits from variables. Limits from reaction matrices are not considered.

Active: If a limit of the linked variable is violated, only the part of the display which reaches into the limit violation is displayed in the color of the respective limit.

If the variable has several defined limits, the respective areas of the display are always displayed in the color of the corresponding limit.

Inactive: If a limit of the linked variable is violated, the complete display is displayed in the color of the violated limit.

Default: inactive

## 10.28 WPF-Element

With the WPF dynamic element, valid WPF/XAML files in zenon can be integrated and displayed.

#### Info

All brand and product names in this documentation are trademarks or registered trade marks of the respective title holder.

## 10.28.1 Basics

#### **XAML**

XAML stands for Extensible Application Markup Language. The description language developed by Microsoft and based on XML defines the syntax in Silverlight applications and WPF user interfaces. XAML makes it possible to separate design and programming. The designer prepares the graphical user interface and creates basic animations that are then used by the developers/project planners. The project planner can control these .xaml files in a purposeful manner and animate them accordingly.

#### WPF

WPF stands for Windows Presentation Foundation and describes a graphics framework that is part of the Windows .NET framework:

- ▶ WPF displays the programming environment.
- XAML describes, based on XML, the interface hierarchy as a markup language. Depending on the construction of the XAML file, there is the possibility to link properties, events and transformations of WPF elements with variables and functions of CD PRODUCTNAME<.</p>
- ► The framework unites the different areas of presentation such as user interface, drawing, graphics, audio, video, documents and typography.

According to Microsoft, WPF is supplied with Windows 7, Windows Vista and Windows Server 2008 and is available for Windows XPSP2 or later and Windows Server 2003. Microsoft .NET 3.5 is required for execution.

#### WPF in process visualization

XAML makes different design possibilities possible for zenon. Display elements and dynamic elements can be adapted graphically regardless of the project planning. For example, laborious illustrations are first created by designers and then imported into zenon as an XAML file and linked to the desired logic. There are many possibilities for using this, for example:

#### **DYNAMIC ELEMENTS IN ANALOG-LOOK**

Graphics no longer need to be drawn in zenon, but can be imported directly as an XAML file. This makes it possible to use complex, elaborately illustrated elements in process visualization. Reflections, shading, 3D effects etc. are supported as graphics. The elements that are adapted to the respective industry environment make intuitive operation possible, along the lines of the operating elements of the machine.

#### INTRICATE ILLUSTRATIONS FOR INTUITIVE OPERATION

The integration of XAML-based display elements improves the graphics of projects and makes it very easy to display processes clearly. Elements optimized for usability make operation easier. A clear display of data makes it easier to receive complex content. The flexible options for adapting individual elements makes it easier to use for the operator. It is therefore possible for the project planners to determine display values, scales and units on their own.

#### **CLEAR PRESENTATION OF DATA AND SUMMARIES**

Grouped display elements make it possible to clearly display the most important process data, so that the equipment operator is always informed of the current process workflow. Graphical evaluations, display values and sliders can be grouped into an element and make quick and uncomplicated control possible.

## **INDUSTRY-SPECIFIC DISPLAYS**

Elements such as thermometers, scales or bar graphs are part of the basic elements of process visualization. It is possible, using XAML, to adapt these to the respective industry. Thus equipment operators can find the established and usual elements that they already know from the machines in process visualization at the terminal.

#### ADAPTATION TO CORPORATE DESIGN

Illustrations can be adapted to the respective style requirements of the company, in order to achieve a consistent appearance through to the individual process screen. For example, the standard operation elements from zenon can be used, which can then be adapted to color worlds, house fonts and illustration styles of the corporate design.

#### Transfer of values from zenon to WPF

zenon always works internally with the double Or string. These are sent to the WPF element. The WPF element is embedded in a .NET container. It usually needs to be converted so that the data type can be used. This conversion can automatically be carried out by .NET.

The values are sent in accordance with the following rules:

- ▶ If the .NET type (system.object) for zenon is not evident, the value is sent as it is to .NET. .NET must take care of the display or conversion itself.
- ▶ If the .NET type is a Boolean type (system.Boolean), then zenon writes according to the .NET convention 0 or -1.
- ▶ If the .NET type is known, a check is carried out to see if .NET can convert the value. The converter from .NET is used for this.
  - Yes: The value is sent.
  - No: The value is sent nevertheless. If .NET reacts with an error message, the value of zenon is converted into a string and sent again.

## **Referenced objects**

In WPF not only standard objects such as rectangles, buttons, text fields, etc. can be used, but also WPF user controls, which are referenced as assemblies.

WPF user controls are individually created objects. For example, this element can look like a tacho and provide special properties and optical effects, such as a "Value" property, which causes the pointer of the tacho to move and display the value when it is set.

The workflow for this:

- The appearance of a user controls is labeled with standard objects, which are offered by WPF.
- ▶ The properties and interactions are programmed.
- ▶ The whole package is compiled and present in the form of a .NET assembly.

This assembly can also be used for WPF projects. To do this, it must be referenced (linked) in the WPF editor (for example: Microsoft Expression Blend). To do this, select the assembly in the zenon file selection dialog:

From this point in time, the WPF user controls of the assembly in the tool box can be selected under Custom user controls and used in the WPF project.

#### **USED REFERENCED ASSEMBLIES IN ZENON**

To use an assembly in zenon, this must be provided as a file.

Collective files in .cdwpf format administer these independently; no further configuration is necessary. Assemblies must be added to the Files folder for .xaml files:

- ▶ Click on Files on the project tree
- ▶ Select Other
- ▶ Select Add file... in the context menu
- ► The configuration dialog opens
- Insert the desired assembly

When displaying a WPF file in the wpf element (Editor and Runtime), the assemblies from this folder are loaded. It is thus also ensured that that when the Runtime files are transferred using Remote Transport, all referenced assemblies are present on the target computer.

A collective file (.cdwpf) can exist alongside an XAML file with the same name. All assemblies (\*.dll) from all collective files and the Other folder are copied to the work folder. Only the highest file version is used if there are several assemblies with the same name.

#### Attention

Assemblies are only only removed after loading when the application is ended. That

If a WPF file with a referenced assembly in zenon is displayed, then this assembly is loaded is in the memory until zenon is ended, even if the screen is closed again. If you would like to remove an assembly from the Files/Other folder, the Editor must first be restarted, so that the assembly is removed.

#### Allocation of zenon object to WPF content

zenon objects are allocated to WPF content using the name of the WPF object. In doing so, note:

Visual objects do not have a RuntimeNamePropertyAttribute property. Therefore at the time when the WPF content is loaded and created, the additional information of name is not available.

Thus a clear allocation of zenon objects to WPF objects is not possible. Therefore only logical objects are listed in the configuration dialog of zenon. Which WPF objects the RuntimeNamePropertyAttribute has available is visible in MSDN or on the Microsoft website.

#### WORKAROUND

Nevertherless, the following workaround is possible to animate visual objects:

For visual elements, the animateable property is linked to the text property of an invisible text box using a data connection.

Because the text box as a logical object supports the name property, this is displayed in zenon.

The textbox property can also be animated with zenon.

This visual object is also indirectly animated as a result.

#### Workflows

The WPF/XAML technology makes new workflows in process visualization possible. The separation of design and functionality ensures a clear distinction of roles between the project planners and designers; design tasks can be easily fulfilled by using pre-existing designs, which no longer need to be modified by the project planner.

The following people are involved in the workflow to create WPF elements in zenon:

- Designer
  - illustrates elements
  - takes care of the graphics for MS Expression Design
- MS Expression Blend operator
  - Animates elements
  - Creates variables for the animation of WPF elements in zenon, which project planners can access
- Project planner
  - · Integrates elements into zenon:
  - stores logic and functionality

We make a distinction:

- ▶ Workflow with Microsoft Expression Blend (on page 132)
- ▶ Workflow with Adobe Illustrator (on page 133)

## **Workflow with Microsoft Expression Blend**

When using Microsoft Expression Blend, a WPF element is created in four stages:

- 1. Illustration of elements in MS Expression Blend (on page 134)
- 2. Open element in Ms Expression Design and export as WPF
- 3. Animation in MS Expression Blend (on page 134)
- 4. Integration into zenon (on page 177)

You can find an example for creating a WPF elements with Microsoft Expression Blend in the Create button as XAML file with Microsoft Expression Blend (on page 134) chapter.

## **Workflow with Adobe Illustrator**

Based on traditional design processes with Adobe Illustrator the following workflow is available:

- 1. Illustration of elements in Adobe Illustrator (on page 139)
- 2. Import of .ai files and preparation in MS Expression Design (on page 141)
- 3. WPF export from MS Expression Design (on page 141)
- 4. Animation in MS Expression Blend (on page 143)
- 5. Integration into zenon (on page 185)

You can find an example for creation in the Workflow with Adobe Illustrator (on page 138) chapter.

## 10.28.2 Manual for designer

This section informs you how to correctly create WPF files in Microsoft Expression Blend and Adobe Illustrator. The tutorials on Creating a button element (on page 134) and a bar graph element (on page 138) show you how fully functional WPF files for zenon can be created from pre-existing graphics in a few steps.

The following tools were used for this:

- ► Adobe Illustrator CS3 (AI)
- ► Microsoft Expression Design 4 (ED)
- Microsoft Expression Blend 4 (EB)
- ▶ zenon 6.51

Info

If referenced objects (assemblies) are used in WPF, note the instructions in the Referenced objects (on page 129) chapter.

## **Workflow with Microsoft Expression Blend**

With Microsoft Expression Blend, a WPF element:

- ▶ is illustrated
- ▶ is converted into WPF format using MS Expression Design
- animated

The following example shows the illustration and conversion of a button element into an XAML file.

**Note:** A test version of "Microsoft Expression Blend" can be downloaded from the Microsoft website.

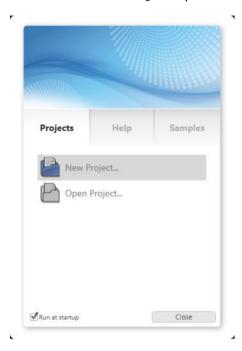

## Create button as XAML file via Microsoft Expression Blend

## **CREATE BUTTON**

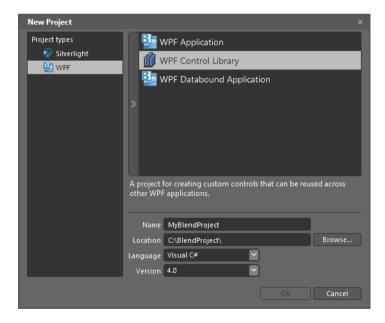

1. Start Expression Blend

2. select the New Project Option

- 3. Select WPF as project type
- 4. give it a path and name of your choice (MyBlendProject, for example)

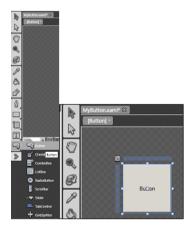

The Language and Version settings can be ignored, because no functionality is to be programmed.

- 5. After the dialog has been confirmed with ox, Microsoft Blend creates a new project with the chosen settings. Expression Blend adds an empty XAML file which already contains a class reference.
- 6. Delete the CS file that belongs to the XAML file using the context menu.
- 7. Rename the XAML file MainControl.xaml to MyButton.xaml.
- 8. The development size of the file is set at 640 x 480 pixels as standard and must still be changed:
  - a) switch to XAML view
  - b) correct the size to 100 x 100 pixels
  - c) Delete the class reference x:Class="MyBlendProject.MyButton"

9. Switch to Design view

- 10. add a button via the tool bar
- 11. define the properties

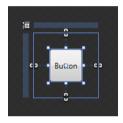

Width: 50Height: 50

Margins: 25

The button is therefore at the center of the control.

12. Save the changes and open the file in Internet Explorer to check it. You will see that the button is displayed in a size of 50 x 50 pixels.

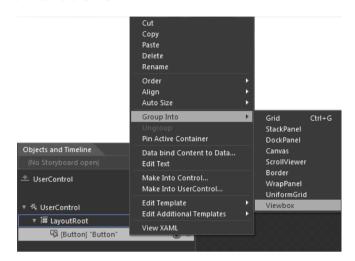

#### **MAKE BUTTON SCALABLE**

If you integrate this status into zenon, the button will always have the exact size of 50 x 50 pixels. Because the button can be implemented as a scalable button, switch to Expression Blend again:

- 1. select the button in the tree view
- 2. select the Group Into->Viewbox button in the context menu
- 3. the button is inserted into a viewbox
- 4. Define the properties of the viewbox
  - Width: Auto
  - Height: Auto

#### 5. save the file

6. If you now open the file in Internet Explorer, the button is automatically scaled when the IE window size is changed. This file will now also automatically adapt to changes in the size of the WPF element in zenon.

#### **CHANGE NAME**

Before you can integrate the file into zenon, you must give the WPF element a name. The WPF elements are not named in Expression Blend as standard, and are labeled with square brackets and their type. zenon content is assigned to WPF content via the name of the WPF elements:

- in tree view, change the name
  - of the button on MyButton
  - of the ViewBox to MyViewBox

This button can now be integrated in zenon (on page 177) as an XAML file.

#### **Workflow with Adobe Illustrator**

When Adobe Illustrator is used, a WPF element:

- ▶ is illustrated in Adobe Illustrator
- ▶ is converted into a WPF in Ms Expression Design
- ▶ is animated in MS Expression Blend

The following example shows the illustration and conversion of a bar graph element into an XAML file.

## Bar graph illustration

A bar graph is created in Adobe Illustrator.

1. Al: Starting element for bar graph

Illustrated in Adobe Illustrator CS3.

2. AI: Path view of bar graph in Adobe Illustrator

- All effects must be converted (Object -> Convert appearance)
- All lines are transformed into paths (Object -> Path -> Contour line)
- Do not use filters such as shading, blurring etc.

#### **NOTES ON COMPATIBILITY**

Illustrations that were created with Adobe Illustrator are in principle suitable for WPF export. However, not all Illustrator effects can become corresponding effects in Expression Design/Blend. Note:

Effect	Description
Clipping masks	Clipping masks created in Adobe Illustrator are not correctly interpreted by Expression Design. These are usually shown in Blend as areas of black color.
	We recommend creating illustrations without clipping masks.
Filters and effects	Not all Adobe Illustrator filters are transferred into Expression Design accordingly: Thus blurring filters, shading filters and corner effects from Illustrator do not work in Expression Design.
	Solution:
	<ul> <li>Most effects can be converted so that they can be read correctly by</li> <li>Expression Design using the Object -&gt; Convert appearance</li> <li>command in Adobe Illustrator.</li> </ul>
	Corner effects from Adobe Illustrator are correctly interpreted by MS Design if they are converted to AI in paths.
Text fields	To be able to link text fields with code, these must be created separately in Expression Blend. "Labels" are required for dynamic texts; simple "text fields" are sufficient for static information.
	There is no possibility to create text labels in MS Design. These must be directly created in MS Blend.
Transparencies and group transparencies	There can be difficulties in Adobe Illustrator with the correct interpretation of transparency settings, in particular from group transparency settings.
	However MS Expression Blend and MS Expression Design do offer the possibility to create new transparency settings.
Multiply levels	These level settings in Adobe Illustrator are not always correctly displayed by MS Expression Blend.
	However, there is the possibility to "Multiply levels" directly in Expression Design.
Indicating instruments and standard positions	To prepare the graphics optimally for animation, the indicator and slider must always be set to the starting position, usually 0 or 12:00 o'clock.
	Thus the position parameters for rotations etc. are also correct in Blend and an animation can be implemented without conversion of position data.

#### **WPF-Export**

WPF files are required for animation in Microsoft Expression Blend. We recommend Microsoft Expression Design for this export, because it provides good results and most Illustrator effects are correctly interpreted.

**Note:** There is a free plug-in for the direct export of WPF files from Adobe Illustrator available on the internet. This plug-in provides a quick, uncomplicated way of exporting from Illustrator, however it is less suited to the current application because it lead to graphical losses. Even color deviations from the original document are possible.

Files in .ai format can regularly be imported into Expression Design; the paths are retained in the process.

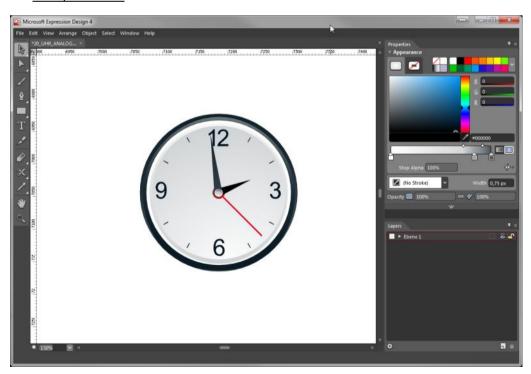

**Attention:** Some common Illustrator effects cannot be displayed by Expression Design correctly however (see Illustration (on page 139) chapter).

We export the pre-created bar graph element in 5 stages:

#### 1. ED: Import

• Import the prepared Illustrator file (on page 139) in Microsoft Expression Design Via File -> Import

#### 2. ED: Optimization

• If the starting file is not correctly displayed in MS Expression Design, it can still be subsequently edited and optimized here

#### 3. ED: Selection

Highlight the element for WPF export with the direct selection arrow in MS
 Expression Design; in this case it is the whole clock

#### 4. ED: Start export

- Start the export via File -> Export
- the dialog for configuring the export settings opens

#### 5. ED: Export settings

- Enter the following export settings:
- a) Format: XAML Silverlight 4 / WPF Canvas

Always name objects: Activate with tick

Place the grouped object in an XAML layout container: Activate with tick

- b) Text: Editable text block
- c) Line effects: Rasterize all

The exported file has .xaml file suffix. It is prepared and animated (on page 143) in MS Expression Blend in the next stage.

#### **Animation in Blend**

With MS Expression Blend:

- static XAML files from MS Expression Design are animated
- Variables for controlling effects that can be addressed by zenon are created

In thirteen steps, we go from a static XAML to an animated element, that can be embedded in zenon:

#### 1. EB:create project

- a) Open Microsoft Expression Blend
- b) Create a new project
- c) Select the Project type Of WPF->WPF Control Library
- d) Give it a name (in our tutorial: My\_Project)
- e) Select a location where it is to be saved
- f) Select a language (in our tutorial: C#)
- g) Select Framework Version 3.5

#### 2. EB: delete MainControl.xaml.cs

- a) Navigate to MainControl.xaml.cs
- b) Delete this file using the Delete command in the context menu

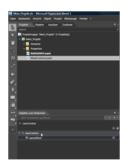

## 3. EB: Open exported XAML file

- a) Open the context menu for My\_Project (right mouse button)
- b) Select Add existing element...
- c) Select the XAML file exported from Microsoft Expression Design, in order to open this in Microsoft Expression Blend

#### 4. EB: Open MainControl.xaml

- a) Open the automatically created MainControl.xaml
- b) In the Objects and Time axes area, navigate to the UserControl entry

#### 5. EB: Adapt XAML code

- a) Click on UserControl with the right mouse button
- b) Select Display XAML in the contextual menu.
- c) Delete lines 7 and 9 in the XAML code:

```
x:Class="My_Project.MainControl"
d:DesignWidth="640" d:DesignHeight="480"
```

## 6. EB: check XAML code

The XAML code should now look like this:

#### <UserControl</pre>

```
xmlns=http://schemas.microsoft.com/winfx/2006/xaml/presentation
xmlns:x=http://schemas.microsoft.com/winfx/2006/xaml
xmlns:d=http://schemas.microsoft.com/expression/blend/2008
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
mc:Ignorable="d"
x:Name="UserControl">
```

#### <Grid x:Name="LayoutRoot"/>

#### </UserControl>

### 7. EB: Copy elements

- a) Open the XAML file imported from Expression Design
- b) Mark all elements
- c) Select Delete in the context menu
- d) Change back to the automatically created XAML file

# 8. EB: Insert element

- a) Click on Layout Root with the right mouse button
- b) Select Insert

# 9. EB: Adapt layout type

- a) Click on Layout root -> Change layout type -> Viewbox with the right mouse button
- b) The structure should now look like this: UserControl -> LayoutRoot -> Grid -> Elements
- c) Give a name for LayoutRoot and Grid by double-clicking on the names

### 10. EB: Texts and values

• Dynamic and static texts are labeled with text fields

Values (numbers) are issued with Labels

### 11. EB: Insert labels

 Labels replace numbers that are to be subsequently linked using INT variables (must be carried out for all number elements)

### 12. EB: Set property

• To display 100%, set the bar graph element's MaxHeight property to 341 (the maximum height of the indicator element is 340)

### 13. EB: prepare for use in zenon

- a) Delete all name labels (names may only be given for elements that are to be addressed via zenon)
- b) Save the XAML file with any desired name
- c) Integrate the XAML file into zenon (on page 185)

A tip for checking: If the XAML file is displayed with no problems in Microsoft Internet Explorer and the window size of Internet Explorer adapts to it, it will also be correctly used in zenon.

# 10.28.3 Engineering in zenon

To use WPF with zenon, Microsoft Framework 3.5 must be installed on both the editor computer and on Runtime.

#### CONDITIONS FOR WPF DISPLAY IN ZENON

The animation is currently available for simple variables; arrays and structures cannot be animated. Therefore the following WPF functions can be implemented in zenon:

- Element properties that correspond to simple data types, such as String, Int, Bool etc.
- Element properties of the "Object" type, which can be set with simple data types
- Element events can be used with functions; the parameters of the events are not however available in and cannot be evaluated in zenon
- Element transformation, for which a render transform is present for the element in the XAML file

Attention: if the content is outside of the area of the WPF element during transformation, this part of the content is lost or is not labeled

# Attention

If the Runtime files were created for a project for a version **before** 6.50, existing WPFelements are not included into Runtime screens.

#### **CREATE WPF ELEMENT**

To create a WPF element

- 1. in the elements toolbar, select the symbol for WPF element or the Elements entry in the menu
- 2. select the start point in the main window
- 3. pull open the element with the mouse
- 4. In properties, select Representation the propertyXAML file in the group
- 5. the file selection dialog opens
- 6. Select the desired file

Files of the following formats are valid

- \*.xaml: Extensible Application Markup Language
- \*.cdwpf: WPF collective file, also shows preview image

(the file must already be present in the Project Manager under Files/graphics or created in the dialog.)

7. configure the link (on page 148)

# Info

If referenced objects (assemblies) are used in WPF, note the instructions in the Referenced objects (on page 129) chapter.

# **CDWPF FILES (COLLECTIVE FILES)**

Rules for the use of collective files:

- The files can be in the ZIP file directly or in a joint folder.
- The name of the XAML file should correspond to the names of the collective file.
- Only one XAML file may be contained.
- The preview graphic should be small and no more than 64 pixels high. Name of the preview file: preview.png or the name of the XAML file with the suffix png.
- ▶ Any number of assemblies can be used. The distinction is made on the basis of the file version in numerical form.
- Collective files do not need to contain an assembly.
- ▶ All folders are searched and only \*.dll, \*.xaml and \*.png files are taken into account.

# **DISPLAY UNDER WINDOWS VISTA/WINDOWS 7**

If a WPF screen contains a slider and Windows Vista or Windows 7 Aero Effects are used, this may lead to refresh problems in zenon Editor.

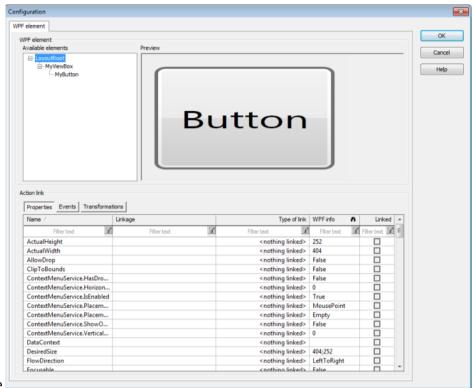

# Configuration of the link

To configure a WPF element

1. In properties, select the Configuration property in the Display group

2. The dialog with three tabs opens with a preview of the XAML file and the elements present in

the file

Parameters	Description
Existing elements	Shows the named file elements in a tree structure. The selected element can be linked with process data.  WPF is assigned to process data based on the element name. Therefore elements are only shown if they and the attendant elements have a name. Allocations are configured and shown in the Properties, Events, Transformations tabs.
Preview	The selected element is shown flashing in the preview.
Properties (on page 150)	Configuration and display of properties (variables, authorizations, interlockings, linked values).
Events (on page 158)	Configuration and display of events (functions).
Transformations (on page 160)	Configuration and display of transformations.
Name	Name of the property.
connection	Selection of link.
Link type	Type of link (variable, authorization, function)
WPF info	Shows the current value for properties in WPF content. For the user, it is directly visible what type of property it is (Boolean, string, etc.).
Linked	Shows if a property is currently being used.  Not contained by default in the view, but can be selected using Context menu->Column selection.

#### Info

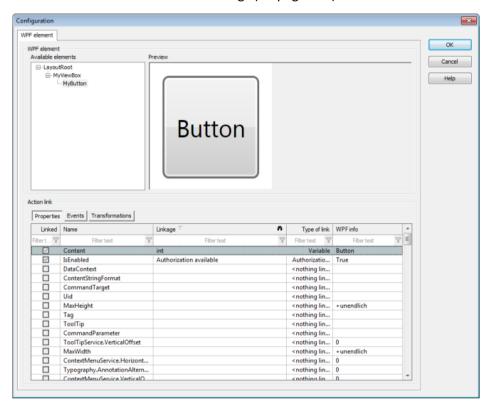

Only logical objects can be displayed in the configuration dialog. Visual objects are not displayed. You can read about backgrounds and how visual objects can be animated in the Allocation of zenon object to WPF content (on page 131).

# **Properties**

The properties enable the linking of:

- ▶ Variables (on page 153)
- ▶ Values (on page 154)
- ► Authorizations and interlockings (on page 156)

Parameters	Description
Name	Name of the property.
connection	Linked variable, authorization or linked value.
	Clicking in the column opens the respective selection dialog, depending on the entry in the Link type column.
Link type	Selection of linking.
WPF info	Shows the current value for properties in WPF content. For the user, it is directly visible what type of property it is (Boolean, string, etc.).
Linked	Shows if a property is currently being used.
	Not contained by default in the view, but can be selected using Context menu->Column selection.

# **CREATE LINK**

### To create a link:

- 1. Highlight the line with the property that is to be linked
- 2. Click in the Link type cell
- 3. select the desired link from the drop-down list.

# Available are:

- <not linked> (deletes an existing link)
- Authorization/interlocking
- Variable
- Value linking
- 4. Click in the Link cell
- 5. The dialog for configuring the desired link opens

Properties of WPF and zenon can be different. If, for example the visibility property is linked, there are three values available in .NET:

- 0 visible
- 1 invisible
- 2- collapsed

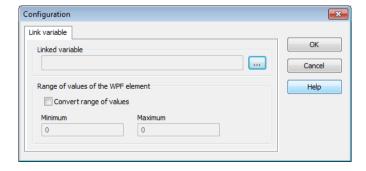

These values must be displayed via the linked zenon variable.

# Link variable

To link a variable with a WPF property:

- 1. Highlight the line with the property that is to be linked
- 2. Click in the Link type cell
- 3. Select from the variable drop down list
- 4. Click in the Link cell
- 5. The dialog for configuring the variables opens

This dialog also applies for the selection of variables with transformations (on page 160). The configuration also makes it possible to convert from zenon into WPF units.

Parameters	Description		
Linked variables	Selection of the variable to be linked. A click on the button opens the selection dialog.		
Value range of WPF element	Data to convert variable values into WPF values.		
Convert value range	Active: WPF unit conversion is switched on.  Effect on Runtime: The current zenon value (incl. zenon unit) is converted to the WPF range using standardized minimum and maximum values.  For example: The value of a variable varies from 100 to 200. With the variables, the standardized range is set to 100 - 200. The aim is to display this change in value using a WPF rotary knob. For this:  • for Transformations, the		
	RotateTransform.Angle property is linked to the variables  Adjust value activated  a WPF value range of 0 to 360 is configured  Now the rotary knob can be turned at a value of 150, for example, by 180 degrees.		
Minimum	Defines the lowest WPF value.		
Maximum	Defines the highest WPF value.		
OK	Accepts settings and ends the dialog.		
Cancel	Discards settings and ends the dialog.		
Help	Opens online help.		

# Link values

Linked values can either be a string or a numerical value of the double type. When selecting the screen, the selected value is sent in WPF content after loading the WPF content.

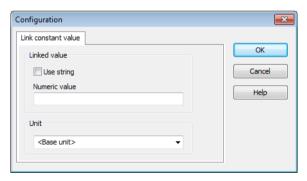

# **Attention**

The data type of the WPF property need not necessarily be double Or string. However only values of the string type or double are sent by zenon. These must be converted to .NET on the WPF page. For details see the Value transfer from zenon to WPF (on page 129) chapter.

To link a value with a WPF property:

- Highlight the line with the property that is to be linked
- 2. Click in the Link type cell
- 3. Select from the value links drop down list
- 4. Click in the Link cell
- The dialog for configuration of value linking opens

Parameters	Description		
Linked value:	Entry of a numerical value or string value.		
Use string	Active: A string value is used instead of a numerical value.		
	The language of string values can be switched. The text is translated in Runtime when the screen is called up and sent in WPF content. If the language is switched whilst the screen is opened, the string value is retranslated and sent.		
String value/numerical value	Depending on what is selected for the Use string property, a numerical value or a string value is entered into this field. For numerical values, a unit can also be selected.		
Unit:	Selection of a unit from the drop down list. You must have configured this in unit switching beforehand.  The unit is allocated with the numerical value. If the units are switched in Runtime, the value is converted to the new unit and sent to WPF content.		
OK	Accepts settings and ends the dialog.		
Cancel	Discards settings and ends the dialog.		
Help	Opens online help.		

# Link authorization or interlocking

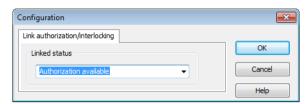

Authorizations cannot be granted for the whole WPF element. The element is allocated a user level. Authorizations are granted within the user level for individual controls. If an authorization is active, the value 1 is written to the element.

To link an authorization or interlocking with a WPF property:

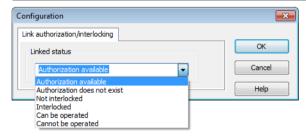

- 1. Highlight the line with the property that is to be linked
- 2. Click in the Link type cell
- 3. Select Authorization/interlocking from the drop down menu
- 4. Click in the Link cell

# 5. The dialog for configuring the authorizations opens

Parameters	Description
Link authorization/interlocking	Setting the authorizations.
Linked status	selection of an authorization that is linked to a WPF control from the drop down list. For example, visibility and operability of a WPF button can depend on a user's status.

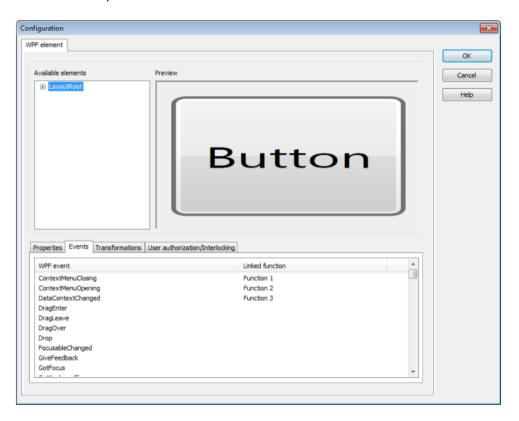

Permission	Description
Authorization present	If the user has sufficient rights to operate the WPF element, a value of 1 is written to the property.
Authorization not present	If the user does not have sufficient rights to operate the WPF element, a value of 1 is written to the property.
Not locked	If the element is not locked, the value $\boldsymbol{1}$ is written to the property.
Locked	If the element is locked, the value $\ensuremath{\mathbb{1}}$ is written to the property.
Operable	If authorization is present and the element is not locked, then a value of 1 is written to the property.
Not operable	If authorization is not present or the element is not locked, then a value of $1$ is written to the property.

# **Events**

Events make it possible to link zenon functions to a WPF element.

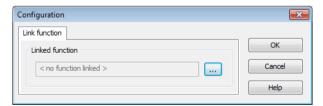

Parameters	Description	
Name	Name of the property.	
connection	Linked function. Clicking in the cell opens the configuration dialog.	
Link type	Selection of linking. Clicking in the cell opens the selection dialog.	
WPF info	Shows the current value for properties in WPF content. For the user, it is directly visible what type of property it (Boolean, string, etc.).	
Linked	Shows if a property is currently being used.  Not contained by default in the view, but can be selected using Context menu->Column selection.	

# **LINK FUNCTIONS**

To create a link:

- 1. Highlight the line with the property that is to be linked
- 2. Click in the Link type cell
- 3. Select from the drop down list function
- 4. Click in the Link cell
- 5. The dialog for configuring the function opens

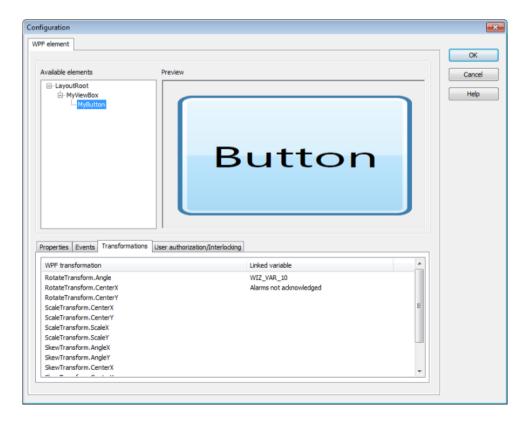

Parameters	Description
Linked function	Selection of the function to be linked. Clicking on the button opens the dialog for Function selection (on page 237).
ок	Accepts selection and closes dialog.
Cancel	Discards changes and closes dialog.
Help	Opens online help.

# **Transformation**

The WPF element does not support rotation. If, for example, the WPF element is in a symbol and the symbol is rotated, the WPF element does not rotate with it. Therefore there is a different mechanism for Transformation with WPF to turn elements or to otherwise transform them. These transformations are configured in the Transformation tab.

Attention: If the content is outside of the WPF element area, this part of the contents is lost, i.e. it is not shown.

Parameters	Description
Name	Name of the property.
connection	Selection of the linked variables.
	Transformations are displayed in XAML as transformation objects with their own properties. If an element supports a transformation, then the possible properties of the transformation object are displayed in list view. (more on this in: Integrate button as WPF-XAML in zenon (on page 177)
	For example, if the linked variable is set at the value of $10$ , then this value is written as a WPF target and the WPF element is rotated by $10^\circ$ .
Link type	Selection of transformation link type.
WPF info	Shows the current value for properties in WPF content. For the user, it is directly visible what type of property it is (Boolean, string, etc.).
Linked	Shows if a property is currently being used.
	Not contained by default in the view, but can be selected using <i>Context menu-</i> > <i>Column selection</i> .

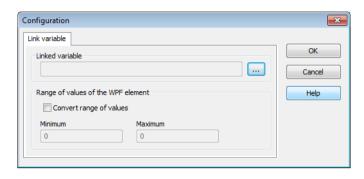

# LINK TRANSFORMATIONS

To link a transformation with a WPF property:

- 1. Highlight the line with the property that is to be linked
- 2. Click in the Link type cell
- 3. Select from the Transformation drop down list
- 4. Click in the Link cell
- 5. The dialog for configuring the variables opens

The configuration also makes it possible to convert from zenon into WPF units.

Parameters	Description		
Linked variables	Selection of the variable to be linked. A click on the button opens the selection dialog.		
Value range of WPF element	Data to convert variable values into WPF values.		
Convert value range	Effect on Runtime: The current zenon value (incl. zenon unit) is converted to the WPF range using standardized minimum and maximum values.  For example: The value of a variable varies from 100 to 200. With the variables, the standardized range is set to 100 - 200. The aim is to display this change in value using a WPF rotary knob. For this:  In transformations, the RotateTransform. Angle property is linked to the variables  Adjust value activated  Adjust value activated  Now the rotary knob can be turned at a value of 150, for example, by 180 degrees.		
Minimum	Defines the lowest WPF value.		
Maximum	Defines the highest WPF value.		
OK	Accepts settings and ends the dialog.		
Cancel	Discards settings and ends the dialog.		
Help	Opens online help.		

# Validity of XAML Files

XAML files are valid subject to certain requirements:

- ▶ correct name space
- no class references

Scalability

#### **CORRECT NAME SPACE**

The WPF element can only display WPF content, i.e.:

Only XAML files with the correct WPF namespace can be displayed by the WPF element. Files that use a Silverlight namespace cannot be loaded or displayed. However, in most cases it is suffice to change the Silverlight namespace to the WPF namespace.

#### WPF namespace:

```
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
```

#### **NO USE OF CLASS REFERENCES**

Because the XAML files can be loaded dynamically, it is not possible to use XAML files that contain references to classes ("class" key in header). Functions that have been programmed in independently-created C#- files cannot be used.

### **SCALABILITY**

If the content of a WPF element is adjusted to the size of the WPF element, then the controls of the WPF element are interlaced in a control that offers this functionality, such as a view box for example. n addition, care must be taken to ensure that the height and width elements are configured as automatic.

#### CHECKING AN XAML FILE TO SEE IF IT IS CORRECT

To check if an XAML file has the correct format:

- Open the XAML file in Internet Explorer
  - If it can be opened without additional plug-ins (Java or similar), then it can be assumed with a high degree of certainty that this file can be loaded and displayed by zenon
  - if problems occur during loading, these are then shown in Internet Explorer and the lines in which problems arise can be clearly seen

The scaling can also be tested in this manner: If the file has been created correctly, the content will adjust to the size of the Internet Explorer window.

### **ERROR MESSAGE**

If an invalid file is used in zenon, then an error message is displayed in the output window when loading the file in the WPF element.

### For example:

"error when loading xaml-Datei:C:\ProgramData\COPA-DATA\SQL\781b1352-59d0-437e-a173-08563c3142e9\FILES\zenon\custom\media\UserControl1.xaml

The attribute "Class" cannot be found in XML namespace "http://schemas.microsoft.com/winfx/2006/xaml". Line 7 Position 2."

#### **Pre-built elements**

zenon is already shipped with several WPF elements. More are available for download in the web shop.

All WPF elements have properties which determine the graphical design of the respective element (Dependency Properties). Setting the values via an XAML file or linking the property via zenon can directly change the look in the Runtime. The following tables contain the respective Dependency Properties, depending on the control.

#### Elements:

- Round display (on page 166)
- ▶ Progress bar (on page 171)
- ► Vertical bar graph (on page 172)
- ► Temperature control (on page 173)
- ► Analog clock (on page 174)
- ▶ Universal slider (on page 175)

# Circular gauge control

Property	Function	Value
CurrentValue	Current value which should be displayed.	Double
IsReversed	Scale orientation - clockwise or anti-clockwise	Boolean
ElementFontFamily	Element font.	Font
MinValue	Minimum value of the scale.	Double
MaxValue	Maximum value of the scale.	Double
ScaleRadius	Radius of the scale.	Double
ScaleStartAngle	Angle at which the scale starts.	Double
ScaleLabelRotation Mode	Alignment of the scale caption.	Enum:  None  Automati  c  Surround  In  Surround  Out
ScaleSweepAngle	Angel area which defines the size of the scale.	Double
ScaleLabelFontSize	Font size of the scale caption.	Double
ScaleLabelColor	Font color of the scale caption.	Color
ScaleLabelRadius	Radius on which the scale caption is orientated.	Double
ScaleValuePrecisio n	Accuracy of the scale caption.	Integer

ValueTextSize	Font size of the value display.	Double
ValueTextColor	Font size of the value display.	Color
IsGlasReflection	Activate the glass effect on the element.	Boolean
GaugeOffsett	Lowering the rotation point of the whole element.	Double

# Progress bar - ProgressBarControl

Property	Function	Value
CurrentValue	Current value which should be displayed.	Double
MinValue	Minimum value of the value area.	Double
MaxValue	Maximum value of the value area.	Double
ProgressbarDivision Count	Number of divisions of the progress bar.	Intege r
VisibilityText	Visibility of the value display.	Boolea n
TextSize	Font size of the value display.	Double
TextColor	Color of the value display.	Color
ProgressBarBoxedCol or	Color of the border of the progress bar.	Color
ProgressBarMarginDi stance	Distance of the progress bar box from the element edge (left, top, right, down).	Double
ProgressBarInactive Brush	Indicator color not active.	Brush
ProgressBarActiveBr ush	Indicator color active.	Brush
ProgressBarPadding	Distance of the progress bar from the progress bar box (left, top, right, down).	Double
ElementBorderBrush	Color of the element border.	Brush
ElementBackgroundBr ush	Color of element background.	Brush

# Bar graph vertical - VerticalBargraphControl

Property	Function	Value
CurrentValue	Current value which should be displayed.	Double
MinValue	Minimum value of the scale.	Double
MaxValue	Maximum value of the scale.	Double
MajorTicksCount	Number of main ticks on the scale.	Integer
MinorTicksCount	Number of sub ticks on the scale.	Integer
MajorTickColor	Color of main ticks on the scale.	Color
MinorTickColor	Color of sub ticks on the scale.	Color
ElementBorderBrush	Color of the element border.	Brush
ElementBackgroundB rush	Color of element background.	Brush
ElementGlassReflec tion	Activate the glass effect on the element.	Visibilit Y
ElementFontFamily	Element font.	Font
ScaleFontSize	Font size of the scale.	Double
ScaleFontColor	Font color of the scale.	Color
IndicatorBrush	Bar graph filling color.	Brush
BargraphSeparation	Number of bar graph dividion.	Integer
BargraphSeparation Color	Color of the scale division.	Color

# ${\bf Temperature\ indicator\ -\ Temperature Indicator Control}$

Property	Function	Value
CurrentValue	Current value which should be displayed.	Double
MinValue	Minimum value of the scale.	Double
MaxValue	Maximum value of the scale.	Double
MajorTicksCount	Number of main ticks on the scale.	Integer
MinorTicksCount	Number of sub ticks on the scale.	Integer
TickNegativColor	Color of the negative main tick (gradient to TickPositivColor).	Color
TickPositivColor	Color of the positive main tick (gradient to TickNegativColor).	Color
MinorTickColor	Color of the sub ticks.	Color
ElementBorderBrush	Color of the element border.	Brush
ElementBackgroundB rush	Color of element background.	Brush
ElementGlassReflec tion	Activate the glass effect on the element.	Visibility
ElementFontFamily	Element font.	Font
IndicatorColor	Color of the indicator filling color.	Color
IndicatorBorderCol or	Color of the indicator border.	Color
MajorTickSize	Size of main ticks on the scale.	Size
MinorTickSize	Size of sub ticks on the scale.	Size
ScaleLetteringDist ance	Distance of the scale caption (vertical), each x. main tick should be captioned.	Integer
IndicatorScaleDist ance	Distance between indicator and scale (horizontal).	Double
ScaleFontSize	Font size of the scale.	Double
ScaleFontColor	Font color of the scale.	Color
Unit	Unit.	String

ElementStyle	Shape/type of element.	Enum:	
		•	SmallFra
			me
		•	Unit
		•	None

# Analog clock - AnalogClockControl

Property	Function	Value
ElementStyle	Shape/type of element.	Enum:  > SmallNumb ers  > BigNumber s
ElementBackgroundBr	Color of element background.	▶ No Brush
ush		
ElementGlassReflect ion	Activate the glass effect on the element.	Visibility
Offset	Value in hours (h) which displays the time lag to the system clock.	Int16
OriginText	Text which is displayed in the clock (e.g. location).	String

# Universal slider - UniversalReglerControl

Property	Function	Value	
CurrentValue	Current value which should be displayed.	Double	
ElementFontFamily	Element font.	Font	
MinValue	Minimum value of the scale.	Double	
MaxValue	Maximum value of the scale.	Double	
Radius		Double	
ScaleRadius	Radius of the scale.	Double	
ScaleStartAngle	Angle at which the scale starts.	Double	
ScaleLabelRotationM ode	Alignment of the scale caption.	Enum:  None  Automatic  SurroundI  n  SurroundO  ut	
ScaleSweepAngle	Angel area which defines the size of the scale.	Double	
ScaleLabelFontSize	Font size of the scale caption.	Double	
ScaleLabelColor	Font color of the scale caption.	Color	
ScaleLabelRadius	Radius on which the scale caption is orientated.	Double	
ScaleValuePrecision	Accuracy of the scale caption.	Integer	
ElementStyle	Display type of the element	Enum:  Knob  Plate  None	
MajorTickColor	Color of main ticks on the scale.	Color	
MinorTickColor	Color of sub ticks on the scale.	Color	

MajorTickSize	Size of main ticks on the scale.	Size	
MinorTickSize	Size of sub ticks on the scale.	Size	
MajorTicksCount	Number of main ticks on the scale.	Integer	
MajorTicksShape	Shape/type of main ticks on the scale.	Enum:	
		▶ Rectangle	
		▶ Trapezoid	
		▶ Triangle	
MinorTicksShape	Shape/type of sub ticks on the scale.	Enum:	
		▶ Rectangle	
		▶ Trapezoid	
		▶ Triangle	
MinorTicksCount	Number of sub ticks on the scale.	Integer	
BackgroundBorderBru sh	Color of the element border.	Brush	

BackgroundBrush	Color of element background.	Brush
PointerCapColorBrus h	Color of pointer fastening point.	Brush
GaugeMiddlePlate	Radius of the element background middle plate.	Double
ValueFontSize	Font size of the value display.	Double
ValueFontColor	Font size of the value display.	Color
IsGlasReflection	Activate the glass effect on the element.	Boolean
KnobBrush	Color of the knob.	Brush
IndicatorBrush	Color of the indicator.	Brush
IndicatorBackground Brush	Background color of the inactive indicator.	Brush
KnobSize	Diameter of the knob.	Double
KnobIndicatorSize	Indicator size of the knob.	Size
ElementSize	Size of the element.	Size
VisibilityKnob	Activating of the knob.	Boolean
ValuePosition	Position of the value display.	Double
ValueVisibility	Activating the value display.	Boolean

# **Examples: Integration of WPF in zenon**

You can see how XAML files are created and integrated as WPF elements in zenon from the following examples:

- ▶ Integrate button as WPF-XAML in zenon (on page 177)
- ▶ Integrate bar graph as WPF XAML in zenon (on page 185)

# Integrate button as WPF XAML in zenon

Example structure:

- ► Creating a button (on page 134) in Microsoft Expression Blend
- ► Integrate into zenon
- ▶ Link to a variable and a function
- ▶ adjust the button to the size of the element
- ▶ Create button

As a first step, create a button as described in the Create button as XAML file with Microsoft Expression Blend (on page 134) chapter. To be able to use the XAML file in zenon, insert this in the project tree in the Files/graphics folder.

#### **INTEGRATE BUTTON**

**Note:** A zenon project with the following content is used for the following description:

- ▶ An empty screen as a start screen
- ▶ an internal variable int of type Int
- ▶ a function Function\_0 of typesend value to hardware With:
  - Direct to hardware Option activated
  - Set was set to 45

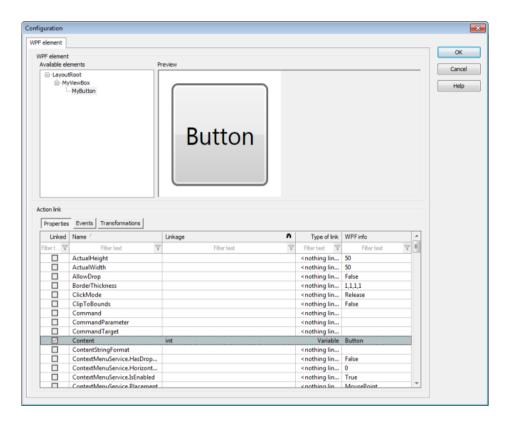

To integrate the button:

- 1. open the empty screen
- 2. place a WPF element in the screen
- 3. select XAML file in the properties window
- 4. Select the desired XAML file (for example MyButton.xaml) and close the dialog
- 5. select the Configuration property

#### **CONFIGURE THE BUTTON**

The configuration dialog shows a preview of the selected XAML file. All elements named in the XAML file are listed in the tree:

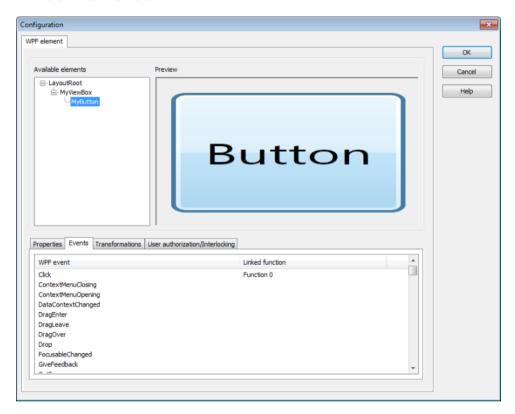

- 1. select the WPF button, which is in LayoutRoot->MyViewBox->MyButton
- 2. Look in the Properties EntryContent tab; this contains the button's text
- 3. Click the Link type column
- 4. Select variable from the drop down list
- 5. Click in the Link column
- 6. the variable selection dialog is opened
- 7. select the int variable to link this variable with the content property

### **EVENTS**

To also assign events:

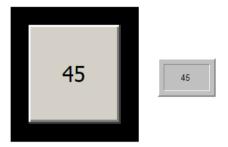

#### 1. select the events tab

- 2. look for the 'Click' entry, this event is triggered by the WPF element, as soon as the button is clicked
- 3. Click in the Link type column
- 4. Select Function from the drop down list
- 5. Click in the Link column
- 6. the function selection dialog is opened
- 7. select Function\_0
- 8. Confirm the changes with ox
- 9. Insert a numerical value element into the screen
- 10. Link this numerical value element to the int variables too.
- 11. Compile the Runtime files and start Runtime.

The WPF element is displayed in Runtime, the button text is 0. As soon as you click on the button, the click event is triggered and the set value function is carried out. The value 45 is sent directly to the hardware and both numerical value and button display the value 45.

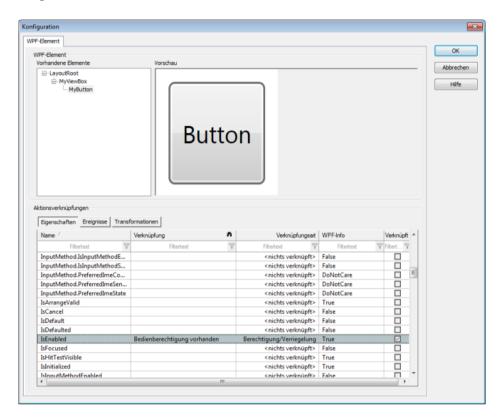

Define a set value of 30 via the numerical value element; this value is then also assumed by the WPF element.

#### **AUTHORIZATION**

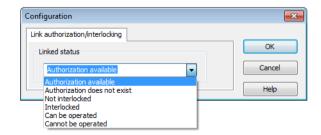

Similar to a numerical value, a WPF element can be locked according to authorizations (lock symbol) or switched to be operable. Set the user authorization level to 1 for the WPF element and create a user called <code>Test</code> withauthorization level 1. In addition, set up the functions Login with dialog and Logout . You link these two functions with 2 new text buttons on the screen.

In the WPF element configuration dialog, select the MyButton WPF button and select the Properties: tab

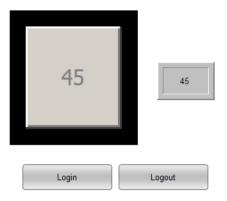

- 1. Select the IsEnabled element
- 2. Click in the Link type column
- 3. Select Authorizations/interlocking from the drop down list
- 4. Click in the Link column
- 5. In the drop-down list, select the Authorized option

6. Close the dialog with ox

Compile the Runtime file and note that Authorizations to be Transferred must also be selected. After Runtime has been started, the WPF button is displayed as deactivated on the screen and cannot be operated. If you now log in as the user Test, the button is activated and can be operated. The button is locked again as soon as you log out.

#### **TRANSFORMATION**

The XAML files must still be adapted to use transformations:

- 1. Switch to the Expression Blend program
- 2. select MyButton, so that the properties of the element are visible in the events window

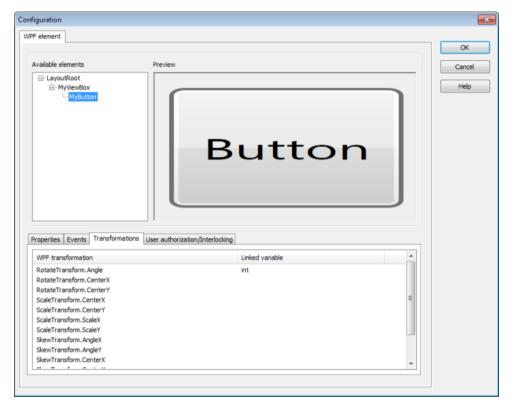

3. Under Transform at RenderTransform Select the Apply relative transform Option

As a result of this, a block is inserted into the XAML file, which save the transformation settings in runtime.

- 4. Save the file and replace the old version in zenon with this new file.
- 5. Open the WPF element configuration dialog again:

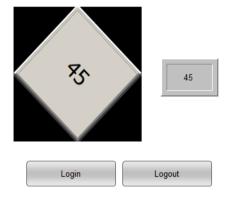

- a) select the MyButton button
- b) select the Transformations tab

- c) Select the RotateTransform. Angle element
- d) Click in the Link type column
- e) Select Transformations from the drop down list
- f) Click in the Link column
- g) the variable selection dialog is opened
- h) select the int variable to link this variable with the RotateTransform.Angle property

Compile the Runtime files and start Runtime. Log in as the **Test** user and click on the button. The button has the value 45 and the WPF element rotates by 45°.

### Integrate bar graph as WPF XAML in zenon

Example structure:

- ▶ Creating a bar graph (on page 138) in Adobe Illustrator and converting it to WPF
- ► Integrate into zenon
- ► Linking with variables
- ▶ Adapting the bar graph WPF element

#### **CREATE BAR GRAPH**

The first step is to generate a bar graph as described in the Workflow with Adobe Illustrator (on page 138) chapter. To be able to use the XAML file in zenon, insert this in the project tree in the Files/graphics folder.

#### **INTEGRATE BAR GRAPH**

**Note:** A zenon project with the following content is used for the following description:

- ► An empty screen as a start screen
- ► Four variables from the internal driver for
  - Scale 0

- Scale central
- Scale high
- Current value
- ► A variable from the mathematics driver for displaying the current value (255)

To integrate the bar graph:

- 1. open the empty screen
- 2. place a WPF element in the screen
- 3. select XAML file in the properties window
- 4. Select the desired XAML file (for example bar graph\_vertical.xaml) and close the dialog

## **ADJUST BAR GRAPH**

Before configuration, the scale of the XAML file is adapted if necessary:

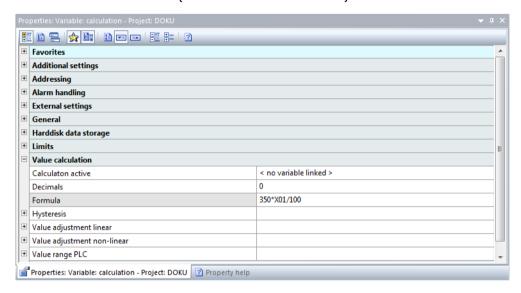

To do this:

- Create a new mathematics variable that calculates the new value in relation to the scaling, for example:
- Variable: 0-1000
- Mathematic variable {value created in xaml file}\*Variable/1000

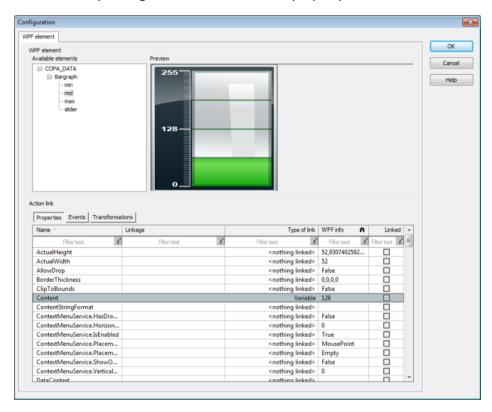

The XAML file is then configured.

#### **CONFIGURE BAR GRAPH**

- 1. Click on the WPF element and select the Configuration property
- 2. The configuration dialog shows a preview of the selected XAML file.

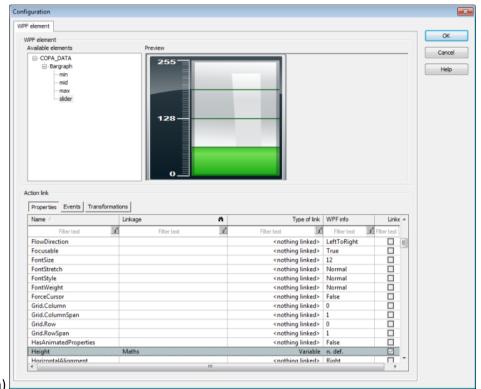

3. Select the minimum value, the average value and the maximum value and link each of these to the corresponding variable in the content property

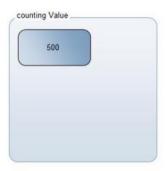

4. Select the slider and link the value property to the mathematics variables (in our example:

calculation)

# 5. Check the project planning in Runtime:

# **Troubleshooting**

### **ENTRIES IN LOG FILES**

Entry	Level	Meaning	
Xaml file found in %s with different name, using default!	Warning	The name of the collective file and the name of the XAML file contained therein do not correspond. To avoid internal conflicts, the file with the name of the collective file and the suffix .xaml is used.	
no preview image found in %s	Warning	The collective file does not contain a valid preview graphic (preview.png Or [names of the XAML file].png). Thus no preview can be displayed.	
Xaml file in %s not found or not unique!	Error	The collective file does not contain an XAML file or several files with the suffix .xaml. It cannot be used.	
Could not remove old assembly %s	Warning	There is an assembly that is to be replaced with a newer version, but cannot be deleted.	
Could not remove old assembly %s	Error	A new version is available for an assembly in the work folder, but it cannot be copied there. Possible reason: The old example is still loaded, for example. The old version continues to be used, the new version cannot be used,	
file exception in %s	Error	A file error occurred when accessing a collective file.	
Generic exception in %s	Error	A general error occurred when accessing a collective file.	

# 10.29 Numerical value

You display numerical values with the numerical values dynamic element.

To create a numerical value in a screen:

- 1. Select the numerical value symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window
- 3. pull open the element while pressing and holding the left mouse button

- 4. the dialog to assign a numerical value (on page 238) opens
- 5. select the desired variable and define the desired properties in the properties window

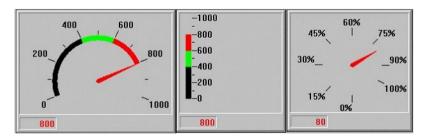

The following applies in runtime: A decimal value can be entered with a comma as well as with a period as a separator. It is always displayed as a period.

# 10.30 Indicating instrument

You display the indicating instrument with the indicating instrument dynamic element.

To create an indicating instrument in a screen:

- select the Indicating Instrument symbol in the Elements tool bar or in the Elements dropdown list
- 2. select the start point in the main window
- 3. pull open the element while pressing and holding the left mouse button
- 4. the dialog to assign a numerical value (on page 238) opens
- 5. select the desired variable and define the desired properties in the properties window

#### **COLOR-CODED DISPLAY OF THE LIMIT VIOLATION**

At limit violations the color from the variable can color the whole area or only the area starting from the limit violation. This functionality is controlled via property Explicit in group Representation.

This property affects only the display of values with defined limits from variables. Limits from reaction matrices are not considered.

Active: If a limit of the linked variable is violated, only the part of the display which reaches into the limit violation is displayed in the color of the respective limit.

If the variable has several defined limits, the respective areas of the display are always displayed in the color of the corresponding limit.

Inactive: If a limit of the linked variable is violated, the complete display is displayed in the color of the violated limit.

Default: inactive

# 10.31 Status Element

You control a screen symbol with a Status Element dynamic element. In doing so, properties of a linked variable such as colors or flashing for example are transferred to a symbol. You can therefore also show statistical limit value texts.

To create the Status Element in a screen:

- 1. select the Status Element symbol in the Elements tool bar or in the Elements drop-down list
- 2. select the start point in the main window
- 3. pull open the element while pressing and holding the left mouse button
- 4. the dialog to assign a variable (on page 238) opens
- 5. select the desired variable and define the desired properties in the properties window

Info

Instead of the dynamic element Binary element the dynamics properties of the according element can be used.

# 11. Edit screen element

The are many possibilities available to you for editing screen elements:

- Graphic actions (on page 194)
- Automated replacement (on page 225)
- Background graphics (on page 236)
- Selection dialog functions (on page 237)
- Variables selection dialog (on page 238)

#### **Graphic actions** 11.1

Graphic actions are also possible in zenon. To do this, use:

- Element properties
- Commands in the Edit menu
- Actions with the mouse:
  - Holding down the ctrl key when moving the mouse copies the element.
  - Moving with the right mouse button pressed opens the content menu, with a choice of whether to copy or move the item
- the context menu

# Info

Graphic actions such as shading and blurring can have an effect on the performance of the system, both in the editor and in runtime.

#### **ENTERING VALUES**

To enter values within a defined limit, there are also sliders for many properties. These can be accessed via the . . . button+. Changes in values made with the slider are displayed in the properties field immediately.

When selecting colors, the color activated in the palette is displayed directly in the object as a preview.

#### 11.1.1 **Truncations**

The elements Rectangle (on page 113) and Button (on page 43) and Polygon (on page 110), Polyline (on page 112) and Tube (on page 114) can be displayed with truncations.

# 💡 Info

Truncations are available only with limitations if property Windows CE projectis activated or if property Graphics quality has value Windows Base.

#### **RECTANGLE AND BUTTON**

You define the degree of truncation with the properties in Rounded corners node. 2 values can be given for each corner point:

- X value: Percentage value for the rounding based on the width of the element
- Y value: is a percentage value for the rounding based on the height of the element

0% means no rounding.

100 % means a quadrant.

If the Proportional property is activated, only the X value can be entered.

The values can be defined separately for each angle. If the value of an angle is set at -1, it then takes its rounding value from the All x [%] or All y [%] property.

# Info

If the value for All x [%] or All y [%] is changed, all values are set to -1 on the corresponding axis. Therefore different values can be re-harmonized very easily.

Hint: There is a small yellow triangle in the lower right quadrant of the element. Click on it with the mouse and move the triangle up to the desired rounding.

## Example:

There is a GIF file on the button with a transparent background. A red color gradient was defined for the button. The rounding of the angles was defined with All x [%] and Proportional, afterwards this value was changed individually for the lower left angle.

If the With brightness values property is used for displaying the fill color, no rounded edges can be used. If this element is activated for an element, that uses rounded-off corners, the element is displayed with non-rounded corners.

### POLYGON, POLYLINE UND TUBE

You can define the degree of rounding for polygons, polylines and tubes with the Rounding property in the Representation node. Enter a value between 0 and 1 for this.

#### 11.1.2 Effects for screen elements

Several graphical elements can be highlighted with the help of effects in the Runtime.

You can find additional effects in chapter effects for frames (on page 254).

#### **Glow effect**

Many zenon support the glow effect.

#### **REQUIREMENTS**

To use glow effect for a graphical element, the following requirements must be fulfilled:

- ► The project property Graphical design/Graphics quality must be set to DirectX Hardware or DirectX Software. For details see chapter Graphics quality (on page 12).
- ► The graphical element must be supported.

  Except for the following exceptions all graphical elements are supported: WMF, symbols, combi element, ActiveX, WPF, all Win32 control elements, windows and several special control elements.
- ► The element must be visible.

  If the element is invisible, the glow effect is invisible automatically as it is derived directly from the element.

#### **CONFIGURATION**

To configure the glow effect for a supported element:

- 1. make sure that property Graphics quality is set to DirectX Hardware or DirectX Software
- 2. create the element
- 3. go to property node Effects
- 4. activate the Activate property in the Glow (only DirectX) node
- 5. configure transparency, color, spread and visibility

If you configure several properties for the same effect, the stronger is executed in the Runtime. For details, see pependance of the configuration section. (For example: An invisible glow effect is always invisible; the settings for flashing has no effect anymore.)

Default value for the glow effect:

- ▶ Activate: inactive
- ▶ Only active if clicked:inactive
- ► Transparency [%]:20 %
- ► Spread [pixel]:15 pixel
- ▶ Coloring: inactive
- ► Color: #FFFF90 (yellow)

- ▶ Variable for color:none
- ▶ Variable for visibility:none
- ▶ Take over visibility from limit:inactive
- ▶ Visible from: 0
- ▶ Visible to:0
- ▶ Variable for flashing:none
- ▶ Take over flash color from limit:inactive
- ▶ Make 2. flash state invisible: inactive

#### **DEPENDENCIES OF THE CONFIGURATION**

#### **VARIABLE FOR VISIBILITY**

Visibility has especially strong effects. If the glow effect is set to invisible, flashing and color is ignored. Dependencies:

- Variable for visibility is linked and Take over visibility from limit is active:
  - Invisible in the limit is activated: Glow effect is invisible.
  - Invisible in the limit is not activated:
     The glow effect configured in the properties is displayed. Dependent of the settings the glow effect can also flash.
- 2. Variable for visibility is linked and Take over visibility from limit is not active:
  - The variable value lies within the limits of properties of Visible from and Visible to:
    - The glow effect configured in the properties is displayed. Dependent of the settings the glow effect can also flash.
  - The variable value lies outside the limits of properties of Visible from and Visible to:
    - Glow effect is invisible

3. Variable for visibility is not linked:

The glow effect configured in the properties is displayed. Dependent of the settings the glow effect can also flash.

#### **VARIABLE FOR FLASHING**

For all states for which the originally configured glow effect is displayed, you get the glow effect which is configured in the properties. At this for example the color for a limit can come from an own variable; for details see Color from variable.

- 1. Variable for flashing is linked, Take over flash color from limit is active and Make 2. flash state invisible is active:
  - Limit was violated:
    - Glow effect flashes and alternates between colored glow effect (from limit violation) and the originally configured glow effect.
  - Limit was not violated:
     Glow effect does not flash and the glow effect is displayed as it was originally configured.
- 2. Variable for flashing is linked, Take over flash color from limit is active and Make 2. flash state invisible is not active:
  - Limit violation is active:
    - Glow effect flashes and alternates between colored glow effect (from limit violation) and no glow effect.
  - Limit violation is not active:
     Glow effect does not flash and the glow effect is displayed as it was originally configured.
- Variable for flashing is linked and Take over flash color from limit is not active:
  - Limit violation is active:
    - Glow effect flashes and alternates between originally configured glow effect and no glow effect.
  - Limit violation is not active:
     Glow effect does not flash and the glow effect is displayed as it was originally configured.

Variable for flashing is not:
 Glow effect can be displayed dependent on other properties.

#### **COLOR FROM VARIABLE:**

Represents the possibility to define the color of the glow effect at normal view via the limit of a variable. This is also true for the normal view when the glow effect does not flash.

- 1. Variable for color linked:
  - a) Limit violation is active:

The color from the violated limit is used.

- b) Limit violation is not active:

  For coloring the glow effect the defined color from property Color is used.
- Variable for color not linked:For coloring the glow effect the defined color from property Color is used.

### **COLORING:**

Defines whether the glow effect is created as image of the actual element or whether it is colored with a single color.

- 1. Coloring active and Variable for color linked:
  - a) Limit violation is active:

For coloring the glow effect the color from the violated limit is used.

b) Limit violation is not active:

For coloring the glow effect the defined color from property Color is used.

2. Coloring active and Variable for color not linked:

For coloring the glow effect the defined color from property Color is used.

3. Coloring not active: An image of the actual element with all corresponding colors of the element for the glow effect is used.

#### **HINTS FOR CONFIGURATION**

To receive good results:

- ▶ Select a rather lower value for Transparency [%]. Without coloring the value may be a little bit higher than with coloring.
- ▶ Do not select a too small value for Spread [pixel]. It should be >5 for the effect to be visible outside of the element.
  - Attention: Too high values (>20) can lead to the glow effect being reduced very much. In this case the visibility can be increased by reducing the transparency. In general the glow effect needs a lot of performance. Thus you should use it consider it well when and where to use it. A higher value for Spread [pixel] costs more performance which especially affects elements which lie close together.
- As for DirectX the glow effect (just like the shadow) is derived from the original element, dynamic changes of the element affect the effect. In addition bitmap graphics can be equipped with this effect. Thus for example a PNG graphic with semi-transparent areas as well as a GIF animation obtain a correct glow effect which is created dynamically during the display. The glow effect just as the shadow also affects text by which correlating effects can be achieved.

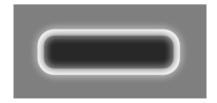

### **Examples for glow effects**

#### **GLOW EFFECT**

Element without glow effect:

Element with glow effect:

## **COLORS**

Default color 0xFFFF90 (yellow):

Color 0xFFFFFF (white):

# **TRANSPARENCY**

0% transparency:

20% transparency:

60% transparency:

## **SPREAD**

0 pixel spread and 0% transparency:

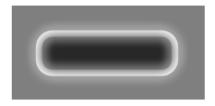

5 pixel spread and 0% transparency:

10 pixel spread and 0% transparency:

20 pixel spread and 0% transparency:

Color 0xFFFF90, 5 pixel spread and 20% transparency:

Color 0xFFFF90, 20 pixel spread and 20% transparency:

#### **TEXTS**

5 pixel spread and 0% transparency:

Text

Color 0xFF0000, 5 pixel spread and 0% transparency:

Text

Large font with 15 pixel spread and 0% transparency:

Large font with color 0xFF0000, 35 pixel spread and 20% transparency:

## **PART-TRANSPARENT GRAPHIC**

# Original:

20 pixel spread and 20% transparency:

Color 0xFF0000, 20 pixel spread and 20% transparency:

Without color, 20 pixel spread and 20% transparency plus shadow with 40 pixel distance, 60% transparency, black and 5 pixel soft focus.

#### **ELEMENT CHANGES**

3D button in contrast colors, 15 pixel spread and 0% transparency on 3D button:

3D button in contrast colors, pressed with 15 pixel spread and 0% transparency on 3D button:

## **Troubleshooting**

#### **OUTPUT**

Entry	Level	Description
DirectX: Screen'Screen name' - Element ' Element name' uses an effect which cannot be displayed with the selected graphics setting.	Warning	At an element the glow effect is activated. However DirectX Softwaree or DirectX Hardware is not selected or not available.

#### CHECK LIST FOR ERROR LOCALIZING

- Is DirectX turned on?
- ▶ Is DirectX available on the system? An according check can carried out by activating the debug messages in the Diagnosis Viewer. For successful support, an appropriate message is displayed.
- ▶ Does the element support the glow effect?
- ► Is the element visible?
- ► Cause static properties (e.g. transparency) the glow effect not to be displayed or displayed differently?
- ► Cause dynamic properties the glow effect not to be displayed or displayed differently?

▶ Is a property selected which causes the glow effect only under certain circumstances (e.g. button element with property "Only active if pressed")?

### **Frame and Shadows**

Elements can be expanded with frames and shadows.

**Exception:** Status elements cannot obtain shadows.

# Info

If the transparency of an object (for example the background color) is changed, the display of the preconfigured shading also changes accordingly. The values for colors and transparencies of shading remain the same in the process.

#### ALLOCATE FRAME AND SHADOWS

- ▶ To give an element a frame, select Frame in the property Border type node Borders/Shadows.
- ▶ To give an element a frame, select Frame in the property Border type node Borders/Shadows.

### FOR SHADOWS AND FRAMES, YOU CAN DEFINE

- Distance: distance of the frame or shadow to the element.
- ► Frame color: Color of frame or shadow.

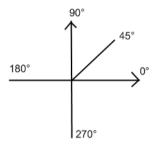

## FOR FRAMES, YOU CAN DEFINE

Line width: The width of the frame.

# FOR SHADOWS, YOU CAN DEFINE

Angle: The angle in degrees with which the shadow falls, starting from the outside right counterclockwise.

- Transparency: Transparency of the shadow between 0 and 100%, with 0% being opaque and 100% being transparent.
- Size of shadow: Size of shadow in pixels.
- Blurring: Blurs the surface color and makes the transition to shadow softer. **Note:** if a value is irregularly set to 0 here, then the calculation affects system performance.

# Info

Transparency for lines or filling colors of an element have an effect on the shadow. For example: If the filling color is set to 100% transparent, then no shade will be visible for the fill area.

## **Examples**

Shade with an angle of 45 degrees moved by 10 pixels

# Shade with an angle of 45 degrees moved by 30 pixels

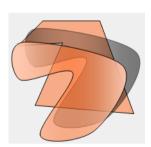

Shade with size of 30 pixels

Shade with size of -20 pixels

Shade with a size of -20 pixels and transparent color gradient in the element  $% \left( 1\right) =\left( 1\right) \left( 1\right) \left($ 

Rounded rectangle with a blur of 10

### 11.1.3 Move element

To move elements, use:

#### **FROM VERSION 6.50**

the properties from the respective element:

- ▶ Position
- ▶ Size and rotation dynamic

You can also animate elements with properties

- ▶ Colors dynamic in the node Color
- ▶ Flashing in the node Visibility/flashing
- ▶ Visibility in the node Visibility/flashing

### **UP TO AND INCLUDING VERSION 6.22 AND RUNTIME COMPATIBILITY**

▶ Alternatively, you can also use the Move Symbol (on page 118) dynamic element

# 11.1.4 Color gradient and transparency

Elements can be given color gradients or switched to transparent.

To do this, select the corresponding element properties in the Color node:

#### **COLOR GRADIENT**

Color gradients can be set in the following direction for the following elements:

Element	Linea r	Defined point	Define point with beams
Rectangle	yes	yes	yes
Circle	yes	yes	no
Segment of a circle	yes	yes	no
Polygon	yes	yes	yes
Button	yes	yes	yes

To define a color gradient, select Color Gradientas a Filling pattern.

You can now define the color gradient via the properties of the group Color gradient. You can also define the color gradient with the mouse. To do this, click on the yellow circle in the element with (connecting line to the middle point) and move the circle until you reach the desired gradient.

# Info

Right angles are positioned horizontally at angles between 45° and 135° and between 225° and 315°.

The With brightness values property is not available for polygons.

#### COLOR GRADIENT UNDER WINDOW CE OR FOR GRAPHICS QUALITY WINDOWS BASIS

Under Windows CE or for settings Windows Basis for property Graphics quality, color gradients for vector elements can only be accomplished via brightness values. The Color gradient property is not available. For the display of color gradients use property:

- ▶ Offset [%]: only works for element rectangle
- Angle [°]: only works for element rectangle
- ▶ Brightness outside
- ▶ Brightness inside

#### Note:

Property With brightness values need not extra be activated.

Property Angle [°] can only be changed in steps of 90° under Windows CE and at setting Windows Basis for property Graphics quality.

#### **BUTTON**

For element button under Windows CE and Windows Basis the following is also true:

- ► For property Filling the values Starting from a defined point and Starting from a defined point with beams are not available.
- ► The Angle [°] property is not available.

#### **TRANSPARENCY**

You can switch an element to be completely transparent with the Transparent property.

To switch elements to be partially transparent, use the properties for filling color transparency, gradient color and frame color. Here, you define the covering power of the colors with values between 0 and 100 percent. In doing so, 0 is invisible and 100 is opaque. All values between this appear transparent according to how they are set.

## **EXAMPLES**

Transparency: filling color = 100, filling color 2 = 100

Transparency: filling color = 50, filling color 2 = 100

Transparency: filling color = 0, filling color 2 = 100

# Info

Control elements to control list fields such as screen scroll bars do not support transparency.

#### Transfer format 11.1.5

To transfer the properties of a selected element to another one / multiple elements:

#### 1. Transfer to an element:

- a) Click on element with original properties -
- b) Click on the Transfer properties Symbol or the corresponding command in the context menu
- c) Click on target element: Properties are transferred

#### 2. <u>Transfer to multiple elements:</u>

- a) Select source element -
- b) Select target element with Ctrl key held down (source and target elements are highlighted)
- c) Click on the Transfer properties symbol or the corresponding command in the context menu
- d) The source element's properties are transferred to the target elements.

If several elements were chosen as source, the properties of the first selected element are transferred.

Info

#### Accept properties via properties window:

If several elements are highlighted, the properties of the last respective highlighted element in the properties input is displayed. If the properties window is displayed in the Grouped view mode or in the All properties mode mode, the respective property can be transferred to all highlighted elements by pressing the Return key. This is not possible in the dialog view mode. For details, see the Properties window chapter, Multiselect section.

#### **RULES FOR TRANSFERRING FORMATS**

#### **TRANSFERRED ARE:**

▶ Properties that directly define an element in form, color, and appearance and are not influenced by a variable.

## NOT TRANSFERRED ARE:

- Deactivated properties
- ▶ Direct properties that it does not make sense to transfer, such as texts and graphics files.

## Exception:

- Graphics files for a switch are copied as you normally always want to have the same switches.
- Graphics files for buttons are not copied as different ones are normally used.
- Properties from groups:
  - Authorization
  - Automatic Line Coloring
  - General
  - Position
  - Size and rotation dynamic
  - Runtime
  - VBA
  - Write set value

- ► Everything that comes directly from variables
- Variables and linked functions

# 11.1.6 Copy, Insert and Move

To copy, move or delete elements on a screen, use

- ▶ Commands in the Edit menu
- ► Actions with the mouse:

Holding down the ctrl key when moving the mouse copies the element. Moving with the right mouse button pressed opens the content menu, with a choice of whether to copy or move the item

▶ the context menu

## MOVE

Objects can be moved with the mouse or the keyboard, with the exception of frames. You can use special effects in combination with function keys when moving:

Кеу	Action	Result
ctrl	move with mouse	object is copied.
Shift	move with mouse	object can only be moved horizontally and vertically.
Shift	move with arrows	Each key press moves the object by 10 pixels.
Right mouse button	move with mouse	The context menu lets you choose between Copy and Move.
Space bar		Mouse pointer becomes a hand. With this hand, the editing area can be moved with the left mouse button.

## 11.1.7 Add and delete dots

# ADD AND DELETE DOTS FOR POLYLINES (ON PAGE 112), POLYGONS (ON PAGE 195) AND TUBES (ON PAGE 114):

#### **ADDING CORNERS:**

To add corners (corner points):

- move the mouse cursor to a line of the polygon:
- right-click
- Select menu item Adding a node in the selected element from the context menu

or:

- ▶ press Ctrl and Shift simultaneously
- move the mouse cursor to a line of the polygon:
- ▶ the mouse cursor changes to an arrow with a plus-symbol
- ▶ left-click in order to add a corner

### **REMOVING CORNERS:**

- ▶ move the mouse cursor to a corner of the polygon:
- right-click
- ▶ Select menuitem Deleting the node in the selected element from the context menu

or:

- ▶ press Ctrl and Shift simultaneously
- ▶ move the mouse cursor to a corner of the polygon:
- ▶ the mouse cursor changes to an arrow with a plus-symbol
- ▶ left-click to delete the corner

### 11.1.8 Arrows in vector elements

A symbol for the start and end of a line can be defined for all vector elements that display open figures. This applies for:

- ▶ Line
- Polyline
- ▶ Unfilled arc of a circle
- ▶ Unfilled segment of a circle

To add a symbol:

- 1. ensure that the Graphics quality property (Screens node) is activated
- 2. draw the element
- 3. In properties, in the End of line group, select the properties for:
  - a) Start type: Symbol for start of line.
  - b) End type: Symbol for end of line.
  - c) Size: enlargement factor for line width. The factor relates to the line width of the vector element as defined in the Line width [Pixel] property. Default = 0

The following symbols are available:

from left or to the left:

from the right or to the right:

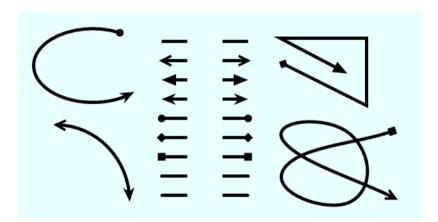

Info

These elements are not available:

- ▶ under Windows CE, because Graphics quality must be activated
- ▶ with a filled circle segment
- with a filled arc of a circle

### **Example for arrows**

Vector elements with start and end symbols with an enlargement factor of 1.5:

### 11.1.9 Grid

The grid makes it possible to align elements precisely on the screen.

The basic settings are in the Options/Settings menu:

Grid settings	
Display grid	Active: Shows the grid that can be defined in the main window under Grid type. Inactive: Grid is not displayed.
Position in grid	Active: Screen elements are automatically aligned with the grid.

	This function is independent from the option Display grid.
Grid color	Defines the grid color. The windows color palette is used for selection.
Grid type	Defines the type of grid : solid, dotted or intersections.
Grid pitch [in pixels]	Defines the horizontal and vertical distance between unique marker points. Therefore, it also defines how finely scaled element sized can be displayed. Recommended grid distance: 10 pixels horizontally and vertically.

### IN THE SCREEN CONTEXT MENU, YOU DECIDE

Menu entry	Description
Display grid	Switch grid to visible or invisible.
Use grid	Elements are aligned in the grid.
Use magnetic points	Touch points of objects move into place when neared and align themselves to each other.

If grid points are 5 pixels or less, only the grid lines that are more than 5 pixels apart are displayed. The smaller grid lines are also used tor the positioning.

### 11.1.10 Font

A default font is automatically created when creating a project. This is provided as the standard font for new objects. The default font cannot be deleted. If you require other fonts:

- create the desired font in the Fonts node (subnode of Screens)
- ▶ select the font in the object properties (node Representation, property Font)

### 11.1.11 Selecting

Objects are selected by clicking the mouse. To select several objects:

- When clicking, hold down the shift or ctrl key or
- drag a connection rectangle with the mouse

To deselect an object when more than one object are selected at the same time, click it with the ctrl key held down.

### **CHANGE THE SEQUENCE OF SELECTION**

If objects are to be aligned to each other, the first object selected serves as a reference. You recognize the reference object by the fully-filled touch points. To make another object the reference object:

- 1. hold down the shift key
- 2. click on the object that is to serve as the reference object with the mouse

#### **ALIGNING A SELECTED OBJECT**

You can find more information on aligning objects in the chapters on Editor/Tool Bar/Alignment and Editor/Menu Bar/Edit

### 11.1.12 Scale, center and zoom

#### **SCALING**

This you can scale elements in two ways:

- 1. proportional: Hold down the shift key when scaling
- 2. around the center: hold down the shift key to do this

Note: If an angel dissimilar to 0 via property Rotation angle [°] was defined for an element, scaling via arrow keys is not possible.

# Info

### Scaling of symbols:

If the symbol contains a static text element and is embedded in this element as text,

- Is scaled in the Editor
- Is not scaled in Runtime

This only applies to symbols. Embedded text is neither scaled in the Editor nor in Runtime in all arrangements.

### **CENTER**

The currently selected element can be centered in the editing window with the H key.

#### ZOOMING

You can read information on zooming screens in the Screens toolbar chapter (manual: Editor)

### 11.1.13 Keyboard shortcuts

Shortcuts for the graphic editor:

**Note for shortcuts:** The plus sign (+) means that keys a pressed together.

For example:

Ctrl+A means: Hold key ctrl and then press key A.

Ctrl++ means hold key ctrl and press key +.

### **GENERAL**

Command	Key combination
Main window: Scroll content with 'moving hand'	Press and hold Space
Close current screen	Ctrl+F4
Open properties	Alt+Return

### **SELECT**

Command	Key combination
Select several objects	Press Shift or Ctrl
Deselect selected object during multi-select	Ctrl+mouse click
Selection: Change sort order. Defines the element on which all others realign	Press Shift during selection
Select hidden objects	1. Press Alt
	2. Click object and move it
Select all elements of a screen.	Ctrl+A
Select next element according to the order of their creation	Tab
Select previous element according to the order of their creation	Shift+Tab

### **POSITIONING**

Command	Key combination
Move selected object.	Cursor keys
Move by 10 pixels each time you press a cursor key	Shift+arrow keys
Move only horizontally or only vertically	Press Shift during moving
Centers the selected object in the working section	Н

### **ACTIONS**

Command	Key combination
Saves changes	Ctrl+S
Pastes element from the clipboard	Ctrl+V
	Shift+Ins
Inserts element from the clipboard at its original position; original and copy lie congruently on top of each user	Ctrl+Shift+V
Copies selected element.	Ctrl+C
	Ctrl+Ins
Copy instead of move	Press Ctrl during moving
Deletes selected element	Del
Cuts out the selected element	Shift+Del
	Ctrl+X
Undoes changes	Ctrl+Z
	Alt+Backspace
Add or delete node in the selected element. Add: Mouse cursor turns to plus symbol (+). Delete: Mouse cursor turns to minus symbol (-). Works for polylines, polygons and pipe elements.	Ctrl+Shift
Cancel drawing of polylines and polygons	S
Cancel drawing of polylines and polygons and delete the section which was drawn last	Esc
Move selected elements one level up	+
Move selected elements one level down	-
Move selected elements to the foreground	Ctrl++
Move selected elements to the background	Ctrl+-

# **SCALING**

Command Key combination	
-------------------------	--

Change size	Move mouse cursor to the handle so that the mouse cursor changes to an arrow. After that you can position accurate to the last pixel with the help of the Cursor keys or in steps of 10 pixels with the help of the Cursor keys+Shift.  Note: If an angel dissimilar to 0 via property Rotation angle [°] was defined for an element, scaling via arrow keys is not possible.
Scaling object around the center	Press Alt during scaling.
Proportional scaling	Press Shift during scaling

### 11.1.14 Assign key to control element

Operable elements in a screen can be linked using a key combination and operated in this way. This applies, for example, to:

- ▶ Execution of control elements and assigned functions such as print, move screen, etc.
- ► Send value (such as with switch)
- ► Set focus of certain windows (such as curve list in Extended Trend or Comboboxes in the Recipe Group Manager)

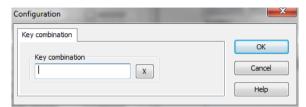

The element control function can be carried out with the keyboard in Runtime.

To assign a key to a control element:

- 1. Highlight the control element
- Navigate to the Key combination property (object properties -> Runtime -> Keyboard operation)
- 3. Click on the . . . button or in the input field

4. The dialog for defining the key combination is opened

Parameters	Description
Key combination	Input of the key combination.
	Click in the field and press the desired key or key combination, for example: A. The key combination is displayed in the input field.
x	Deletes the character sequence in the input field.
ОК	Accepts key combination and closes dialog.
Cancel	Discards input/change and closes dialog.
Help	Opens online help.

# 11.2 Replace link of variables and functions

If several variables or functions are to be replaced at the same time, it is best if you use automatic replacement for:

- Replacing linking in the Editor screen (on page 227)
- ► Replacing linking with screen switching (on page 229)
- Replace indices (on page 233)
- ► Linked symbols (on page 297)

You can also read about automated replacement for configuration in the Efficient configuration with zenon manual in the Reusing elements Section.

### 11.2.1 Naming conventions

To be able to replace variables and other elements securely, the naming should be systematic and standardized if possible. You therefore support not only the reusability, but also maintenance and reverse engineering.

Different systems support you with systematic naming.

#### FOR EXAMPLE: ENERGY INDUSTRY

#### Germany

- ► KKS (Kraftwerk-Kennzeichen-System Power Plant Classification System), for details (in German), see http://de.wikipedia.org/wiki/Kraftwerk-Kennzeichensystem (http://de.wikipedia.org/wiki/Kraftwerk-Kennzeichensystem)
- ► DIN 6779 (Kennzeichnungssystematik für technische Produkte und technische Produktdokumentation Classification System for Technical Products and Technical Product Documentation), for details (in German), see http://de.wikipedia.org/wiki/DIN\_6779 (http://de.wikipedia.org/wiki/DIN\_6779)
- ► AKZ (Anlagenkennzeichnungssystem Equipment Classification System), for details (in German), see http://de.wikipedia.org/wiki/Anlagenkennzeichnungssystem (http://de.wikipedia.org/wiki/Anlagenkennzeichnungssystem)

#### International

► KKS (Power Plant Classification System), for details, see http://en.wikipedia.org/wiki/KKS\_Power\_Plant\_Classification\_System (http://en.wikipedia.org/wiki/KKS\_Power\_Plant\_Classification\_System)

Such standards exist for all industries. It is recommended that their naming convention is used.

#### **POWER PLANT CLASSIFICATION SYSTEM EXAMPLE:**

Variables are to be named in accordance with the KKS in an energy project. A corresponding variable with the label co1 MDY10-QA001 QA07 indicates:

- ▶ Wind energy equipment co1 (row C, no. 1)
- ▶ Wind turbine controlMDY10, Power part QA001,

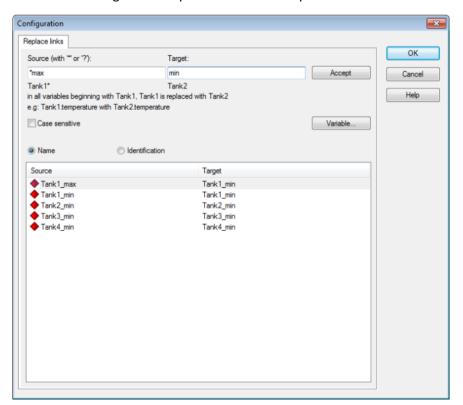

▶ Power protection QA07

### 11.2.2 Replace link in Editor screen

Linked variables or functions can be permanently replaced in the Editor in a rule-based manner. The replacement is not limited to the functions or variables defined in the properties of the Variable / function group. All other variables used the screen can, such as variables for Visibility, Flashing, Size and rotation dynamic and others. Rule-based replacement also works for several elements in a screen at the same time and for elements with embedded symbols.

To replace variables or functions in a rule-based manner in the element directly:

- 1. Highlight the desired element and open it by right clicking the element in the context menu
- Select Replace Links
- 3. The dialog for the replacement of links opens

Property	Description
Source	Enter the partial string to be searched for.
	Place holder * and ? can be used. Placeholders are only permitted as prefix or suffix; e.g. *xxx or xxx*.
Target	Entry of the partial string
Name	Swaps information in process variable names.
Identification	Exchanges information in the identification
Note capitalization	When swapping, be sure that any capitalization is an exact match.
Accept	Swaps target strings from the source for those defined in the target.
Variable/function	Opens the selection list for variables/functions in relation to the selected line in the list. Clicking on the variable in the list defines new target variables.  Alternative: Double-click on the source variable in question.

### **REPLACE**

## A) REPLACE BY MANUAL SELECTION

- ▶ select the element from the list that you would like as the source
- ▶ select a target element via the variable/function button
- ▶ the previous element is replaced by the new one

### B) AUTOMATED REPLACEMENT WITH RULES

- ▶ In the source input field, define the parameters for the elements that you wish to replace
- ▶ define the parameters for the new variables/functions in the target input field
- specify what is to be replaced via Name/Identification
- ► Click on Accept

Several entries are separated by a semicolon (;).

### Example:

Source: A; b

Target: C; d

### Info

The target variable or target function can also be in a different project as the source variable or source function.

### Attention

When replacing variables, be aware of the type and signal resolution. If you replace a variable with one of an incompatible type, this can lead to errors during execution. You will be warned when making the substitution; the substitution will however be carried out.

### Info

Replace via Drag&Drop: Elements that can only contain one variable or function can be swapped by dragging & dropping. Drag the new variable or function to the element using the mouse. It automatically replaces the previous one.

#### 11.2.3 Replace link at screen switch

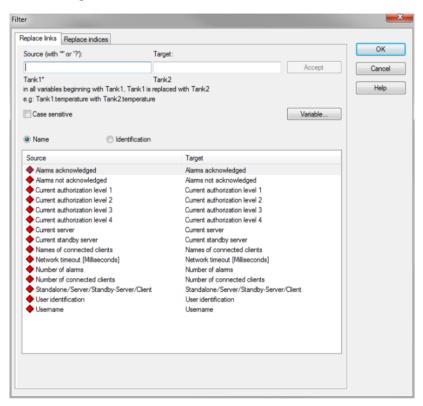

Linked variables or functions in one or more elements, as well as Alias in the ALC can be replaced with screen switching. In doing so, the elements in the screen are not replaced on a lasting basis, but the screen switching is linked in Runtime.

To replace linking when screen switching:

- 1. Configure a screen switching function
- 2. Contains elements that can be replaced in the screen, the dialog for replacement is opened

3. Assign the function to a button in order to be able to execute screen switching in Runtime

Property	Description
Source	Enter the partial string to be searched for.
	Place holder * and ? can be used. Placeholders are only permitted as prefix or suffix; e.g. *xxx or xxx*.
Target	Entry of the partial string
Name	Swaps information in process variable names.
Identification	Exchanges information in the identification
Note capitalization	When swapping, be sure that any capitalization is an exact match.
Accept	Swaps target strings from the source for those defined in the target.
Variable/function	Opens the selection list for variables/functions in relation to the selected line in the list. Clicking on the variable in the list defines new target variables.  Alternative: Double-click on the source variable in question.

### **REPLACE**

## A) REPLACE BY MANUAL SELECTION

- ▶ select the element from the list that you would like as the source
- ▶ select a target element via the variable/function button
- ▶ the previous element is replaced by the new one

### B) AUTOMATED REPLACEMENT WITH RULES

- ▶ In the source input field, define the parameters for the elements that you wish to replace
- ▶ define the parameters for the new variables/functions in the target input field
- specify what is to be replaced via Name/Identification
- ► Click on Accept

Several entries are separated by a semicolon (;).

### Example:

Source: A; b

Target: C; d

## 💡 Info

The target variable or target function can also be in a different project as the source variable or source function.

### Attention

When replacing variables, be aware of the type and signal resolution. If you replace a variable with one of an incompatible type, this can lead to errors during execution. You will be warned when making the substitution; the substitution will however be carried out.

### Info

Replace via Drag&Drop: Elements that can only contain one variable or function can be swapped by dragging & dropping. Drag the new variable or function to the element using the mouse. It automatically replaces the previous one.

#### REPLACING INTERLOCKINGS

In the dialog, the variables of the interlockings used in this screen appear next to the variables directly linked to the screen. This also includes the result variable of an interlocking. If a variable was linked to both the elements of a screen and with interlockings of a screen, they only appear once in the dialog.

The variables to be replaced for all interlockings that use these variables are replaced in Runtime. In addition to the variables normally linked to interlocking, the result variables linked to the interlocking are replaced for the screen.

#### Replace indices 11.2.4

When switching screens in Runtime, variables can be replaced dynamically (virtually) using indexing rules. In doing so, variable values can be used as part of the replacement rule.

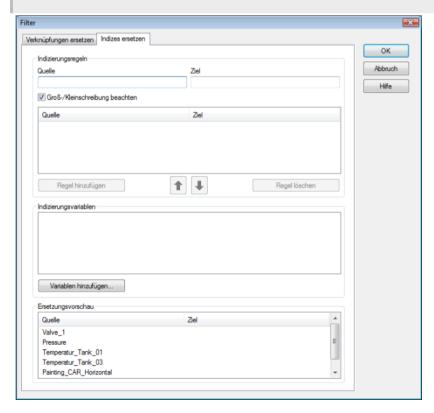

### Attention

Because the names are replaced, variables and functions must always be given different names. Variables and functions are replaced if the names are the same.

### Example:

If there is a variable "test" and a function "test" and the variable "test" is to be replaced, the function "test" would be replaced at the same time.

Tip: Name variables and functions with a respective prefix (such as var\_ and func\_). You therefore always have a overview in lists too.

To configure the replacement of indices:

1. All variables and functions used in the screen are displayed in the Source field of the Replacement preview.

- 2. Left-click the variable or function for which you want to create an indexing rule.
- 3. In the Indexing rules area, the variable/function is entered in the fields source and Target. Alternatively, you can also enter the desired variable/function directly into the source field in the Indexing rules.
- 4. Define the indexing rule. The dynamic part of the rule is inserted in curly brackets, for example {X01}.

### Example:

The source variable Motors1. speed is replaced by the target Motors {X01}. speed, the placeholder xo1 is replaced with the respective value of the index variable in the Runtime.

The replacement rule would thus be:

Source: Motor1

Target: Motor{X01}

- 5. Carry this over to Add Rule by left clicking in the indexing rules.
- 6. All indexing rules that have been created are displayed in this list.
- 7. You can change the order of the entries using the button with the arrow symbol.

Attention: The substitutions are executed in the order in which they are displayed in the list!

- 8. Variables that are not present on the screen but are used in the replacement can be inserted via the Add Variables... button in the Indexing Variables window.
- 9. The variables which are in this list are always kept in the memory in order to minimize waiting time when the screen is loaded.

Info

For the placeholder \* the same rules as for Replace links (on page 227) are valid.

### Attention

If index variables are used in a network project, the Client must first fetch the value from the Server. Then the calculation is executed. On devices with outdated hardware this may cause delay at screen switching.

Therefore in a network project index variables should always be set to DDE active.

### **CROSS-PROJECT**

If the target is in a different project to the source, this can be displayed using '#'.

### Example

Source: VAR\_1

Target: VAR\_1 in Project\_1

You thus enter VAR\_1 as the source and Project\_1#VAR\_1 as the target.

Source: SUBPROJECT1#VAR\_1

Target: {X01}VAR\_1

The index variable X01 is a string variable and has the project name including # as a value, for example "SUBPROJECT4#".

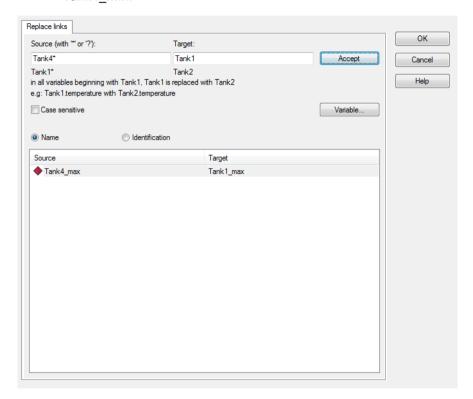

#### Example replace variable rule-based 11.2.5

All variables with "Tank1" in the name are to be replaced with "Tank4".

- 1. Enter "Tank1" into the Source text field. You can include all variables that start with "Tank1" with the \* character.
- 2. Enter "Tank4" into the target text field.
- 3. Click on Accept.

4. The variables Tank1\_max and Tank1\_min are replaced by the variables "Tank4\_max and Tank4\_min.

# 11.3 Background graphics

A graphics file can be displayed in the background of every screen. These graphics are positioned in the visibility level furthest to the back and are covered by all other screen elements. It works along the lines of the background graphics of Windows Desktop.

Options such as centered or tiled are available for positioning. It is not possible to freely move the graphics.

Only graphics data that is already available in the project in the Files/Graphics area can be used. See: Files.

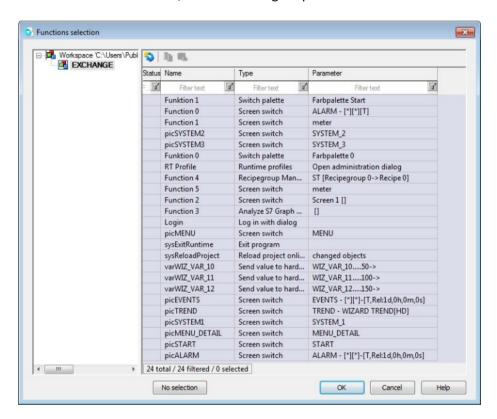

**Tip**: If you wish to use the same background graphics for several screens, you can pre-define the background graphics in the frames. See: Background graphics for frames (on page 253)

**Tip**: Alternatively, a button with a graphics file can be used without a linked function to display a freely-positionable graphics file

# 11.4 Functions Selection dialog

In order to select functions, a filtered dialog is opened:

Element	Description
Project tree	Definition of the project from which the function should be selected.
Selection window	Selection of the function.
No selection	Depending on the element:
	► the dialog is canceled
	<ul> <li>already linked functions are deleted</li> </ul>

**Hint:** The size of this dialog can be adjusted. The dialog size and position are saved.

### **CHANGE LINKED FUNCTION**

1. manually

- in the Project Manager's Detail view open the functions
- drag the desired function on the element while holding the left mouse button
- the previous function is substituted by the new one

### 2. automatic

 Select the entry Replace links from the context menu. For more details see chapter Substitution of variables and functions in dynamic elements (on page 225).

## 11.5 Variable selection dialog

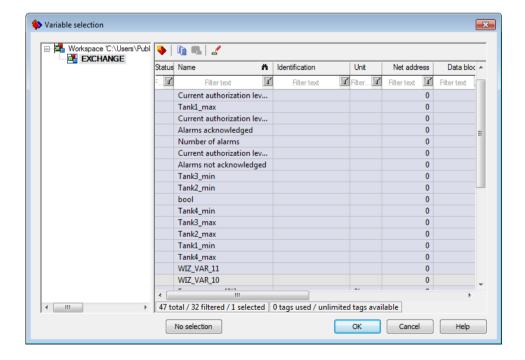

In order to select variables, a filtered dialog is displayed.

**Hint:**The size of this dialog can be adjusted. The dialog size and position are saved.

Variables can also be used throughout projects.

### LINKING A VARIABLE

Elements that can only be linked with one unique variable open the following dialog:

Element	Description	
Project tree	Definition of the project from which the variable shall be selected.	
Selection window	Selection of the variable which shall be linked. It can be linked in two ways:      ■ By double-clicking on the desired variable: The dialog is closed automatically.      ■ By selecting the desired variable and subsequently clicking OK.	
No selection	<ul> <li>Depending on the element:</li> <li>▶ the dialog is canceled</li> <li>▶ Variables that are already linked are deleted (such as linked batch variables in the Historian)</li> </ul>	

**Note:** If the desired variable is not displayed, there can by several reasons for this:

- You have selected a filter and the desired variable does not match the filter: Check whether there is a filter active in the filter line. The information about filtered elements which is displayed at the bottom of the selection window also helps when checking for an active filter.
- The dialog is filtered by the Editor and the variable does not match the filter. The filtered display takes place when only special data types are allowed; e.g. for the dynamic element Numerical value no string variables can be linked.
- You have selected the wring project in the project tree.

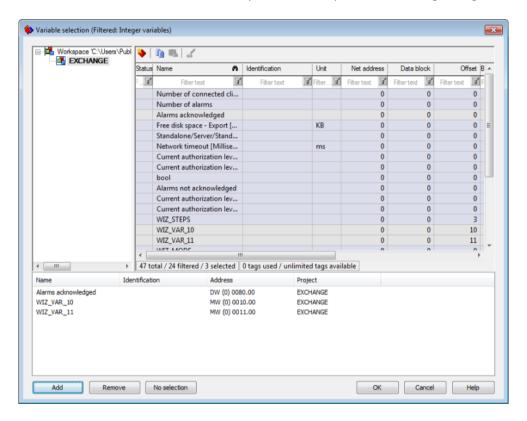

### Attention

The dialog generally allows the choice of multiple variables via the usual Windows keyboard shortcuts, but in this step only one can be linked. For multiple selection the first chosen variable is assigned to the element.

### LINKING MULTIPLE VARIABLES:

Elements that can be linked with multiple variables open the following dialog:

Element	Description	
Project tree	Definition of the project from which the variable shall be selected.	
Selection window	<ul> <li>Selection of the variables:</li> <li>▶ Double click the selected variable in order to add it to the variable list.</li> <li>▶ You can move the selected variable to the variable list via Drag&amp;Drop</li> </ul>	
	➤ Select the desired variable. With the help of Ctrl and/or Shift multi-selection is possible. By clicking Add the selected variables are added to the variable list.	
Variable list	Lists all selected variables.	
Add	Adds the currently selected variable of the selection window to the variable list.	
Remove	Removes the variables which are selected in the variable list from the list.	
No selection	Depending on the element:  • the dialog is canceled	
	<ul> <li>certain links such as batch variables in archiving can be released</li> </ul>	

**Note:** If the desired variable is not displayed, there can by several reasons for this:

- ➤ You have selected a filter and the desired variable does not match the filter: Check whether there is a filter active in the filter line. The information about filtered elements which is displayed at the bottom of the selection window also helps when checking for an active filter.
- ► The dialog is filtered by the Editor and the variable does not match the filter. The filtered display takes place when only special data types are allowed; e.g. for the dynamic element Numerical value no string variables can be linked.
- ▶ You have selected the wring project in the project tree.

▶

### **CHANGE LINKED VARIABLE**

Select the entry Replace links from the element's context menu. For more details see chapter Substitution of variables and functions in dynamic elements (on page 225).

### 12. Frames

Frames form the basis for the layout of the window and the screens displayed during runtime. You structure the display on the screen and determine the position. Each screen is assigned to a frame and displayed in the screen area defined by the frame.

Frames determine the general window properties such as position, size, appearance and manipulation options during runtime. Frames:

- Provide an overview of all windows defined in a project
- ▶ can be freely defined via the Define free frame shape property
- enable special functions to be allocated to all screens available in a frame, for instance:

Return to last screen, set focus on frame, take focus from frame, close frame, acknowledge flashing alarms, print screenshot

- change all screens based on this frame
- Screens always appear in the same size at the defined location in runtime and cannot be moved as desired
- ▶ Frames can always be automatically closed during runtime if the focus is lost
- ▶ Screens within a frame can be changed at will in online operation.

#### Info

If there is no frame when creating a screen, then zenon automatically creates a default frame that covers the whole screen.

### PROJECT MANAGER CONTEXT MENU

Menu item	Action
Frame new	Creates a new frame.
Open frame editor	Opens the frame editor in the main window and shows the list of frames in detail view.
Export XML all	Exports all entries as an XML file.
Import XML	Imports entries from an XML file.  Note: Existing frames are overwritten via the Frames node during XML import. In this case, all screens and their elements are adapted to the new frame.
Help	Opens online help.

### **CREATE FRAME**

To create a palette:

- 1. In the project manager, select the Frames sub item in the Screens node
- 2. select Create New Frame in the context menu
- 3. a new frame is created The initial size is determined by the size of the display and can be set in the monitor administration(Project Properties-> Graphical design -> Monitor administration)
- 4. click in the new frame and drag the frame over the touch point to the desired size
- position the frame at the desired location in the window
- 6. Define the desired properties in the properties window

### Attention

Frames in the global project and the subproject must be named differently.

# **Example**

three areas must be present in the whole project:

- ► A header appears at the top of the screen with the time and a logo.

  a "header" frame is defined for this area. This defines the size and position of the header.
- A menu appears at the bottom of the screen.
   A "menu" frame is created.
- Interim process screens.A "process screen" is created.

The frames are always displayed in the defined size at the defined location. All screens created then are linked to one of these frames and in the Runtime opened in it. If the screen design is changed, because, for instance, menu bars are to be displayed at the top and the header is to be a footer, only the position of the frames need be changed. The screens contained in the frames are automatically carried over.

### 12.1 Frame detail view toolbar and context menu

Menu item	Action
Frame new	Adds a new frame to the list and puts the focus onto this entry.
Open frame editor	Opens the frame editor in the main window.
Define free frame forms	Changes to the main window to define a free frame shape.
Jump back to starting element	If you entered the list via function linked elements, the symbol leads back to the start element.  Only available in the context menu when all linked elements are opened.
Сору	Copies selected entries to the clipboard.
Paste	Pastes the contents of the clipboard. If an entry with the same name already exists, the content is pasted as "Copy of".
Delete	Deletes selected entries.
Export selected XML	Exports selected entries as an XML file.
Import XML	Imports XML files.
	<b>Note:</b> Existing frames are overwritten via the <b>Frames</b> node during XML import. In this case, all screens and their elements are adapted to the new frame.
Remove all filters	Removes all filter settings.
Edit selected cell	Opens the selected cell for editing. The binocular symbol in the header shows which cell has been selected in a highlighted line.
Replace text in selected column	Opens the dialog for searching and replacing texts.
Properties	Opens the Properties window for the selected entry.
Help	Opens online help.

# 12.2 Frame editor

You can define and position all frames in the frame editor.

### Attention

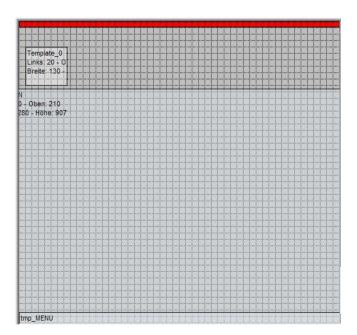

It is not possible to undo actions in the frame editor. The menu item undo(ctrl+z) is not available.

#### Opening the frame editor 12.2.1

To open the frame editor:

- In the project manager, click on the desired frame twice in Frames Detail View or
- select Project Manager -> Frames -> Context Menu -> Open Frame Editor

The size displayed in the frame editor is dependent on the monitor size set in monitor administration. See chapter on monitor configuration.) If the monitor settings are subsequently changed, the frame editor must be closed and reopened in order for it to take the new monitor settings into account.

The red frame for the alarm status line is automatically created at the upper edge of the screen by zenon for each project. Its position can be changed via the properties in the Position group. To do this, the Use standard position property must be deactivated.

#### Display frames in frame editor 12.2.2

Frames can be switched to visible or invisible by:

PropertyDisplay in Frame Editor: activated: displays frame

▶ Drag&drop:

invisible: Drag frame from the main window

visible: drag frame from the detail view into the main window

Detail view-> View of frame editor:

invisible: Deactivate checkbox visible: Activate checkbox

You obtain information on the name and position of the frame in the upper left corner of the frame and via tooltip if you move the mouse pointer over the frame.

### Info

A system menu or an alarm status line is automatically taken into account in the frame editor and always displayed in the foreground. An incorrectly positioned frame can therefore not hide any important information during runtime.

#### 12.2.3 Create new frame

You have two possibilities to create a new frame:

create a new frame:

Project Manager -> Frames -> Context Menu-> Create New Frame or Frame Detail View- > Context Menu -> New Frame

With this, a new standard frame is created in the size defined in monitor properties.

▶ to draw a new frame: Main Window-> Context Menu -> Draw New Frame

The mouse pointer becomes a black square with a cross in the upper left left corner as the starting point. With this, you drag the frame in the size you have defined to the desired position.

#### **POSITIONING FRAMES**

The position and orientation of a frame or a group of selected frame can be selected via the Arrange context menu in the main window.

#### POSITIONING WITH CONNECTION POINTS

If the option 'Use connection points' was activated (see chapter Editor, Section Settings), the connection points of frames stick to those of other frames. In addition, frames can connect to the screen border and to a possibly present (if activated in the project) alarm line.

### Frame with free frame shape

You can adapt the frame shape to your individual wishes using the Freely defineable frame shape property. After you have activated this property, you arrive at the frame editor in one of the following ways:

- ▶ Click on the button of the Define free frame shape property
- ▶ Click on the corresponding symbol frame in the toolbar (on page 244)
- ► Select the menu entry Define Free Frame in the context menu (on page 244) when selecting the frame
- ▶ Select the Define Free Frame menu entry in the Context menu in the frame editor
- Double click on a frame in the frame editor

Here, you can create the frame as you wish with the rectangle, circle, rounded rectangle and polygon elements.

Freely defineable frame shape is not available:

- For alarm status line frame
- Under Windows CE

If the Define free frame shape property is deactivated an existing free frame form is not displayed in either the frame editor or the screen editor.

You decide how the respective element influences the appearance of the frame with the help of the Area utilization property. To do this, the following settings are available:

Parameters	Description
Cover	The surface of the element is used as the screen area.
Cut	The surface of the element is removed from the surfaces underneath. For instance, you can create "holes" in the frame, for example.
ORed	This is either cut out or covered according to whether a covering element is under the element or not.

# Info

The way the surface is used always relates to the surfaces under the element. If you, for example, draw a covering element over a cutting element, the surface is displayed filled. If you reverse the sequence, the cutting element is removed from the covering element.

### 12.2.4 Positioning in Runtime

Frames can be switched to fixed or relatively defined positions in Runtime. In this way, keyboard screens or pop-up screens can be positioned exactly where the mouse pointer or the element to be switched is located. Frames can be switched in runtime:

- at an absolute position
- relative to the mouse position
- relative to the element

Absolute and relative positions are defined in properties.

#### **RETAIN POSITION FOR NEXT TIME**

Windows always take their screen position from the template. If pop up screens are planned and moved whilst the program is running, the pop up screen is moved back to the planned position the next time the screen switching function is activated. Using the Keep position when displaying again property, the template can be set to keep its position as long as it is open, regardless of screen switches. If the property is active:

- ▶ If a screen is opened in Runtime in a manually-moved template, its position is also retained if the screen is switched.
- ▶ If another screen is opened in the in the same template, its position is retained. This also applies for a substituted call.

With this, a different position position for a template can be used on each client, because the local position is always saved.

#### **ABSOLUTE POSITIONING**

The frame is always switched at fixed, pre-defined coordinates. A fixed screen position is always used for all screens that are loaded automatically by the system, e.g. by the time control or a limit violation.

#### **RELATIVE POSITIONING**

Relative positioning is especially suited to loading pop-ups, keyboard screens or command input screens. This is possible for all screen switches, set value inputs with freely defined keyboard screens, and command input screens that are started manually by the user. It does not matter whether the action was triggered by a screen switch function, a set value function or directly via an element. Relative positioning is available for:

- dynamic elements to which you can allocate a function
- dynamic elements that can be used to send a set value (buttons, combined elements)
- Main and Context Menus
- execute the screen-specific function in the Alarm Message List screen

Relative positioning also works for nested function calls, i.e. when screen switching or the setting of values are triggered by a script. If the screen would stand over the screen border, it is automatically positioned at the screen border. This also applies to multi-monitor management, where screen would rise into the neighboring monitor.

### **RELATIVE TO THE ELEMENT**

Positions the reference point of the frame relative to the element from which the screen switch was initiated (e.g. a button or a combined element). The frame's reference point is then always placed on the element's calculated reference point. If the frame cannot be switched off in this position because the screen would then be outside the visible screen area, the alternative reference points are used.

First define a reference point for your frame and then the preferred position in the element. The following settings are available:

Property	Value
Reference point element vertical	below
	top
Reference point element horizontal	Left
	Right
Vertical movement in pixels	Enter the desired movement
Horizontal movement in pixels	Enter the desired movement

#### **ALTERNATIVE POSITION**

Define an alternative position for the reference point of the frame and the reference point at the element. Proceed with the definition of the alternative positions in the same way as with the definition of the favored positions. The alternative position is used when the frame can not be placed at the favored position.

### **RELATIVE TO THE MOUSE POINTER**

The screen is displayed depending on the position of the mouse pointer. If the reference point is at the top left side, the frame will be loaded to the bottom right side of the reference point. If the screen cannot be displayed completely at the configured position, the position will be moved until the complete screen is inside the displayed area of the screen.

Define the frame's reference point above the two properties, vertical reference point and horizontal reference point. The reference point is marked on the frame with a red dot. The following settings are available:

Property	Value
Reference point frame vertical	top
	below
	centered
Reference point frame horizontal	Left
	Right

centered

### Example

you have a button at the right border of the screen and try to position a popup window on its right side:

- Element reference point: Right/centered
- Frame reference point: left/centered

In Runtime, the popup screen will appear on the right side of the button, centered to the middle of the button. The popup screen will not cover the button.

You use the same frame also for a button on the left screen border. There may not be enough room on the right side to completely display the popup screen. The alternative configured position will therefore be used. For this, you place the

- alternative reference point for the element on: left/centered
- the frame's alternative reference point on right/centered

#### 12.2.5 **Deleting frames**

To delete frames, you can:

highlight one or more of the frames with the mouse and select delete in the context menu or press the delete key

highlight one or more of the frames in the detail view and select delete in the context menu or press the delete key

A request to confirm this action is made before it is deleted.

### Attention

Deletion of frames cannot be undone.

## 12.3 Define background graphics for frames

A graphics file can be displayed in the background of every screen. These graphics are positioned in the visibility level furthest to the back and are covered by all other screen elements. They are positioned via properties; it is not possible to position them freely. Only graphics data that is already available in the project manager in the files/graphics area can be used.

If several screens use the same background color, this is defined with the screen frame:

- 1. In properties, click on the Graphics file property in the Background graphic node
- 2. select a file from the files/Graphics node in project manager
- 3. define the position with the Alignment property

this graphics file is then used for all screens that are created using this frame. However, individual graphics files can still be defined as a background screen for each screen.

**Attention!** The graphics file is saved with the screens. Changing the graphics file or how they are set up in the frame is only effective for new screens. Existing screens must be changed manually.

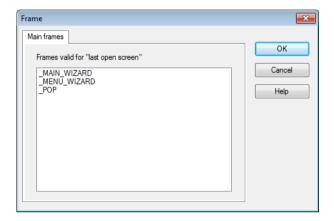

# 12.4 Distributed engineering with frames

In multiuser operation, all usual mechanisms for allowing and accepting changes are implemented. In the frame editor however, in contrast to the screens, every frame is handled individually in the frame editor as opposed to the entire screen being released. For a better overview, frames where changes are not permitted are marked with a dotted border.

#### 12.5 Main frame

Templates that were opened last can be displayed in the system driver using the variable Last screen open. Which templates are incorporated into the display is defined with the Main frames property in the project manager (Graphical design, Runtime general). Click on the ... button to open the dialog for selecting a template:

Several entries can be selected using the combination of Ctrl + a mouse click or Shift + a mouse click. Clicking on oκ confirms the selection.

### 12.6 Effects for frames

Frames can also be provided with effects.

You can find additional effects for screen elements in chapter effects for screen elements (on page 196).

### 12.6.1 Highlight frame

With the help of <code>Highlight frame</code> you can highlight a screen in order to draw attention to a certain screen. For this the frame, on which the screen is based, is highlighted by coloring the remaining area of

the Runtime. For this a color and a transparency are defined for the surrounding of the frame of the screen which covers the screen lying below. The screen lying below cannot be operated.

**Note:** The screens must be based on different frames with different sizes. You must not call up more than one screen with this property at any time.

To use the effect, configure the screen which is to be on top of another, larger screen:

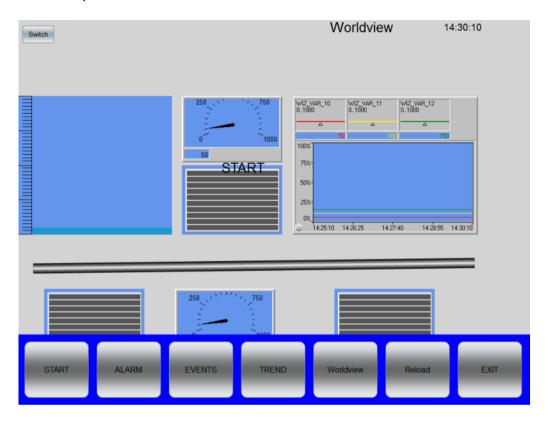

- 1. navigate to group Window style in the screen properties.
- 2. Activate the Modal dialog property.
- 3. Activate the Highlight frame property.
- 4. With property Surrounding color you configure the color with which the surrounding of the active screen should be colored.
  - This property always affects the frame on which the screen is based.
- 5. With property Surrounding transparency configure the transparency of property Surrounding color.
- 6. Engineer a button for the screen in order to be able to close it in the Runtime.

As soon as you open this screen above another, the area surrounding the frame is colored. Thus optically highlighting the screen. Only this screen can be operated. After closing the screen, other screens are displayed in normal color again and can be operated.

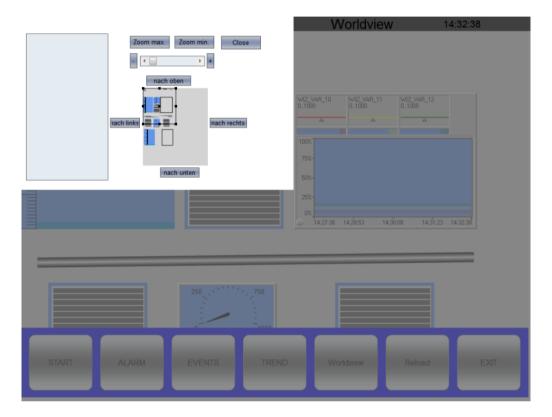

### **EXAMPLE**

Screen is opened:

Second screen with active effect <code>Highlight frame</code> is also opened. Everything outside the additionally opened screen is highlighted with the color defined in property <code>Surrounding color</code> and the transparency defined in property <code>Surrounding transparency</code>.

# 13. Color palettes

Color palettes make it possible to compile individual colors into color palettes. You can define color set such as this, that can be easily edited, both in the editor and in Runtime. All colors that are defined with the help of palette colors can be easily changed over with this.

The uniform design of Company Designs (CD) can be completed very quickly in this way. If necessary, the design can be centrally changed in full (change palette) or only individual colors can be changed (change color in palette).

The zenon approach: Changes can be effortlessly made centrally or even globally with the help of a global project in this way.

#### **CONFIGURATION**

These palettes are created in the editor, can be exported and imported and there is a function to switch these in runtime. Color palettes can be created in both a global project and a local project. All palettes of a project must always contain the same amount of colors; the number of colors can therefore differ between a global project and a local project.

**Attention:** in the event of conflicts in runtime, the local project's color palettes take priority.

The colors of the color palette can be used anywhere where colors are used.

#### PROJECT MANAGER CONTEXT MENU

Menu item	Action
New color palette	Creates a new color palette with the standard names Color palette plus continuous Index number.
Export XML all	Exports all entries as an XML file.
Import XML	Imports entries from an XML file.
Help	Opens online help.

### 13.1 Palettes toolbar and context menu detail view

#### **TOOLBAR AND CONTEXT MENU**

number of colors remains identical in all palettes.  Copy Copies selected colors or color palettes to the clipboard.  Paste Pastes selected colors or color palettes from the clipboard.  If you entered the list via function linked elements, the symbol leads back to the start element.  Only available in the context menu when all linked elements are opened.	no.	Symbol	Action	
function  266) and automatically activates the selected palette in the drop-down list.  Delete color palette  Delete the palette of the highlighted color. Palettes can only be deleted individually  O4  New color  Creates a new color with the standard color white and the standard name Color plus Index number. New colors are always created for for all palettes of the project.  Hint: Give clearly distinct names for the global project and the local project.  Note: The command is only active if the last color in each palette is highlighted. Because: Only the last color of a palette can be deleted, so that the index numbers continue to work. Furthermore, the color must be deleted for all palettes, so that the number of colors remains identical in all palettes.  Copy  Copies selected colors or color palettes to the clipboard.  Paste  Paste  Pastes selected colors or color palettes from the clipboard.  If you entered the list via function linked elements, the symbol leads back to the start element.  Only available in the context menu when all linked elements are opened.  OP Color palette in the editor  Save  Saves all changes to the color palettes.  Export selected XML   Import XML  Imports entries from an XML file.  Opens the property window.	01	New color palette	·	
deleted individually  Creates a new color with the standard color white and the standard name Color plus Index number. New colors are always created for for all palettes of the project.  Hint: Give clearly distinct names for the global project and the local project.  Deletes the selected color from all palettes of the project.  Note: The command is only active if the last color in each palette is highlighted. Because: Only the last color of a palette can be deleted, so that the index numbers continue to work. Furthermore, the color must be deleted for all palettes, so that the number of colors remains identical in all palettes.  Copy  Copies selected colors or color palettes to the clipboard.  Paste  Pastes selected colors or color palettes from the clipboard.  If you entered the list via function linked elements, the symbol leads back to the start element.  Only available in the context menu when all linked elements are opened.  Color palette in the editor  Opens a drop-down lists with all palettes that can be defined in the local project and in the global project.  Save  Saves all changes to the color palettes. #### 13.2 Create and edit colors

You can create color palettes globally or in a local project. Global color palettes are available in all projects, local color palettes are only available in the project in which they were created. If there are conflicts when setting these in runtime, the color projects of the local project take priority(see alsoColor palettes in Runtime (on page 265)).

#### **CREATE COLOR PALETTE**

To create a color palette:

- ▶ select the Color Palettes node (either below Screens in the local project of global project)
- ▶ select the New Color Palette command in the context menu
- a new palette is created with:
  - Standard name color palette plus Index number, for example color 0
  - the same number of colors as the pre-existing palettes, all colors are white as standard

#### **RENAME COLOR PALETTE**

To rename a palette individually:

- select the palette or one or more colors of the palette
- In properties, select the Palette property in the Palette name group

enter the desired palette name

**Tip:** Give them clear names in order to clearly distinguish between the global project and the local project

#### **DELETE COLOR PALETTE**

To delete a palette:

- highlight the palette's complete column
- ▶ In the context menu, select the Delete Color Palette command or press del
- ▶ the palette will be deleted without asking for confirmation.

Note: Palettes can only be deleted individually

### 13.3 Create and edit colors

#### **CREATE COLOR**

In order to create a color:

- select a color or a palette
- ▶ In the context menu, select New Color or press the insert key
- ▶ at the lower end of the color table, a new color is inserted for all palettes with
  - Standard color white and
  - Standard name color plus Index number, for example color 10
- ▶ define the color and give it a name

#### **RENAME COLOR**

To rename a color:

- select the color
- ▶ In properties, select Color the property Identification in the group

enter the desired name

**Tip:** You can already differentiate between a global project and a local project when giving it a name, so that you know where the palette comes from when choosing the color palettes later

#### **DEFINE COLOR**

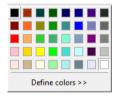

to define a color:

- highlight the desired color in the palette
- enter the color:
  - either directly into the table cell in the detail view, as a hexadecimal code or via the selection dialog by clicking on . . .
  - or in the properties in the Color group in the Property Color field as a hexadecimal code or via the selection dialog by clicking on ...

#### **DEFINE COLOR VIA DIALOG**

To select pre-defined base colors from a dialog or to create your own colors:

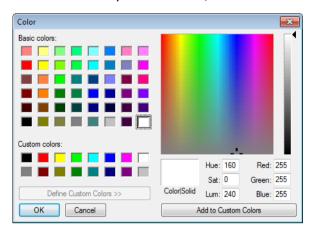

- ▶ in the detail view, click in the cell with the desired color or in Properties Color on . . .
- ▶ the dialog for the selection of standard colors opens

▶ click on a standard color to allocate it

▶ to define your own color, click on the Define Color button

- ▶ define the color
- ▶ using the Add Color button, add it to User-Defined Colors
- select the desired color
- ▶ assign the color by clicking on ox

#### **COPY COLOR**

To copy several colors of the same color definition:

- highlight the hexadecimal code of the color in the input field of the desired color
- ▶ copy the hexadecimal code with ctrl+C or the copy command in the context menu
- insert the hexadecimal code for all colors which should receive the same color definition with ctrl+V or the Insert command in the context menu

#### **DELETE COLOR**

Colors from palette are distinguished clearly by means of their index in the palettes (= row number in palette window). Therefore the colors can only be deleted at the end of the palette, because otherwise the indices of subsequent colors would change. Because all palettes in the project must have the same color, only complete rows can be deleted. To delete a color from all palettes:

- Highlight the rows to be deleted, starting with the lower end of the palette colors
- ▶ In the context menu, select Delete Color or press the delete key

#### 13.4 Use palette in the Editor

#### SELECTING THE ACTIVE PALETTE IN THE EDITOR

In the editor, a palette can be used as the active palette for display and color selection from the local or global project.

To select a palette for display in the editor:

- ► Click on the table of color palettes with the right mouse button.
- ▶ Select Color palette in the editor in the context menu
- select the desired palette from the drop-down list

Note: Palettes from the local project are arranged before those from the global project.

Attention: If there are palettes with the same name in the global and local projects, only the palettes from the local project are offered for selection.

#### Attention

If there is a different number of colors configured per palette in the global and local project, there may be less colors available for the active palette selection!

Palette definitions from the local project always have priority: If there is at least one color configured in the local project palettes, the amount of colors from the local palette are offered; otherwise the amount of a colors in the global project are offered.

Colors missing from the active palette are displayed in white.

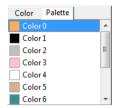

#### **SELECTING THE PALETTE COLORS**

Colors from the palette are assigned in the editor via:

- Dialog in properties
- Drag & drop the description of a color into the corresponding field in properties
- Direct input of the description of a color in the corresponding field in properties

If an element is assigned a color via properties, the color dialog opens with two tabs:

- Colors Selecting a particular color
- ▶ Color palettes: selecting a particular color palette from the active color palette

If there are not palettes with at least one color configured in the local or global project, or if the property does not allow a color to be assigned, only the tab colors are displayed.

### **COLORS FOR MULTI-USER PROJECTS**

Changes to color palettes can only be enabled, transferred or discarded for all palettes of a project.

#### 13.5 Create Runtime files

The palettes of the global project and local project are carried over in a joint list when creating Runtime files. There may be conflicts in doing so. Note:

- ► The local project always has priority.
- ► Each palette displays the unified amount and therefore contains as many colors as the largest palette.
- If the palette of the global project and the local project contain different amounts of colors, the shorter palettes are filled with white, so that all palettes have the same amounts of colors and a color is available in each palette for each color index. With palettes of the same name, the missing palettes of the larger palette are carried over

#### **EXAMPLE:**

- ► There are 3 palettes in the global project: Global 1, Global 2 and Palette 1 with 10 colors each.
- ▶ There are two colors in the local project: Palette 1 and Palette 2 with 5 colors each.

- ► In Runtime there is then:
  - Palette 1: comes from the local project and overwrites Palette 1 from the global project; it contains the 5 colors from the local project plus the colors 6 10 from Palette 1 from the global project
  - Palette 2: contains the 5 colors from the local project plus the colors 6 10 initialized as white
  - Global 1: Contains the 10 colors from the global project
  - Global 2: Contains the 10 colors from the global project

#### **SWITCH COLORS IN RUNTIME**

To switch colors in runtime, you need the Switch palette function (see chapter on switching color palettes (on page 266)).

You can find an example of switching in Runtime in the chapter on the example for editor und Runtime (on page 269).

### 13.6 Switch color palette function

When starting runtime, the first palette in the project automatically becomes active, so long as another palette is not activated via a start script.

The active palette can be changed in runtime by means of the Switch palette function. All screens and elements are then relabeled with the colors of the new palette.

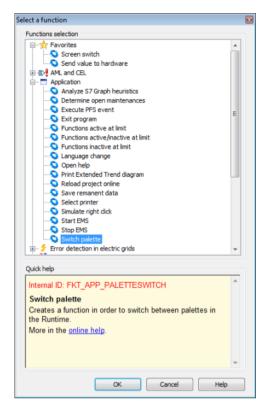

The respective active palette is defined via the name of the palette. If no palette exists with the given name, the first palette in the project is activated.

To create the Switch palette function:

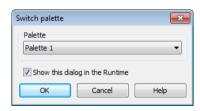

- ▶ In the project manager, select the New Function.. command in the Functions node.
- navigate to Applications

▶ SelectSwitch Color Palette

- confirm with OK.
- ▶ The dialog to select the color palette is opened

Parameters	Description
Color palette	Select the desired color palette from the drop-down list.
Show this dialog in the Runtime	Enables a new color palette to be selected in runtime.

# 13.7 Export and import

Color palettes can be exported as XML files and imported from these.

#### **EXPORT**

To export a palette:

- select the desired palette
  - to select several palettes use the ctrl or shift key or hold down the left mouse button and move the mouse over the title line of the table
  - (Note: selected palettes can no longer be deselected individually)
- ▶ only complete selected palettes can be exported, not individual colors
- select Export selected XML... in the context menu or in the tool bar
- ▶ in the file manager that opens, select a location to save the file and a name for the XML file

#### **IMPORT**

To import a palette:

- ▶ select Import XML... in the context menu or in the tool bar
- ▶ select the file you wish to import in the file manager that opens
- ► The palettes saved in the XML file will be imported
- Attention: The sequence during exporting is taken into account:
  - If, for example, a palette is exported to the third place in the table, this is imported at the same place or added at the end if the project has fewer palettes Palettes already present here are overwritten. That means:
  - If palettes are at the location that is imported to, the names and colors of the existing palettes are overwritten.
  - If a palette is imported to a free location, it is inserted at the end of the sequence and named with the consecutive standard names.
  - If the imported palette features more colors than those that already exist, the missing colors are supplemented with white in the existing palettes
  - If the imported palette has fewer colors than the existing one, the missing colors are accepted by the overwritten palette or supplemented with white, if no palette was overwritten.

•

### 13.8 Error messages

When transferring elements, for example by importing XML files or copying & pasting, some palette colors may no longer be displayed correctly. Possible reasons:

- ▶ no color palettes have been created in the project yet
- ▶ Palettes have a different number of colors
- ► Colors were deleted

The corresponding error message is displayed in the properties input field, the element is displayed in white.

Error message	Reason
No palette loaded!	No palettes were configured in the local and global project.
Palette color not available!	The is no color in the project's palette with the corresponding index.

# 13.9 Example for Editor and Runtime

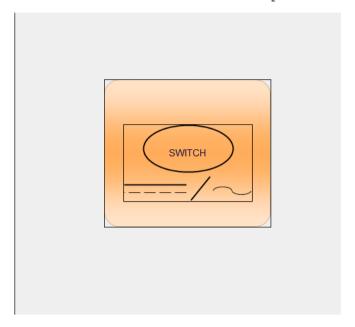

#### IN THE EDITOR

This is how you use color palettes in the editor for example:

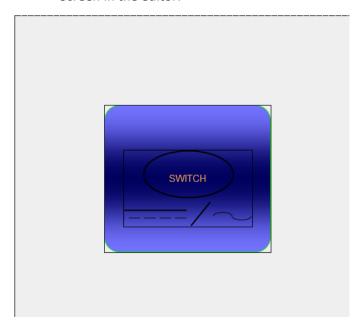

- create a screen with a button with text and a graphic element
- ▶ choose Background color in properties
- ▶ click on ...
- ▶ the dialog for selecting colors opens
- ▶ select the Color palette tab
- ▶ the colors of the active color palette are displayed
- select the desired color

- ▶ repeat this step for the properties Border color and Text color
- ▶ Screen with basic color palette

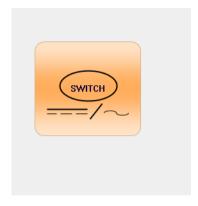

- ▶ In the color palette table, right-click in a cell
- ▶ select Color palette in the editor in the context menu
- ▶ in the drop down list, select a different palette, for example, Palette 2
- Screen in the editor:

#### **IN RUNTIME**

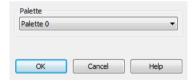

The screen with the color palette activated in the editor is displayed in Runtime.

If you have configured a switching function (see chapter on Color palette switching function (on page 266)), you can change the color palette in runtime.

#### To do this:

- ▶ Click on the element.
- ▶ If the Offer this dialog in Runtime option was activated, a new palette can be selected in Runtime; otherwise the palette given in the function is shown automatically

▶ the element is switched to the new colors

# 14. Fonts

In zenon all the fonts installed in the operating system can be used. The **Fonts** node is under the **Screens** node in the Project Manager.

#### PROJECT MANAGER CONTEXT MENU

Menu item	Action	
Font list new	Creates a new font list in the detail view	
Export XML all	Exports all entries as an XML file.	
Import XML	Imports entries from an XML file.	
Help	Opens online help.	

The selected font must also be present on the target system with Runtime. If the font is not present on the target system, another font present on the system from the same family is used.

### 14.1 Font lists

By default, one font list exists. This is displayed in the detail view if the Screens / Fonts node is selected in the Project Manager.

#### **TOOLBAR AND CONTEXT MENU**

Parameters	Description
Font new	Creates a new font. The Windows dialog 'Font' is opened, where the font type, style, size, etc. can be defined. See chapter Creating a new font (on page 275).
Delete font	Removes the selected font from the font list.
Font list new	Creates a new font list (same functionality as in the Project Manager). See chapter Creating a new font list (on page 274).
Delete font list	Deletes the selected font list.
Save	Saves the changes.
Font list in the Editor	Displays all existing font list, the active one is marked.
XML export selected	Fonts and font lists can be imported/exported. See chapter Import/Export / Screens / Fonts.

The name of the font list can be changed in properties.

### Attention

Name changes performed later on will not be integrated automatically. If you change the name of a font list after creating a function Language Change for this font list, you also have to change the name of the font list in that function.

#### FONT LISTS: GLOBAL PROJECT VERSUS PROJECT

The Editor always has a font list actively switched. To use fonts from the standard project and the global project, the font lists in these two projects must be named the same.

Note when using font lists in global projects:

- If font lists are named the same in a global project and a standard project, the font list of the standard project takes priority in Runtime.
- If there are different names, two font lists are present in the standard project, either one of these is used in Runtime as desired.

To avoid this effect: Plan a language switching function by selecting the font list.

### 14.1.1 Creating a new font list

In order to link elements to fonts, which do not belong to Font list 1, another font list has to be created.

#### **CREATING FURTHER FONT LISTS:**

A new font list can be created in the Project Manager in the section Screens / Fonts with the entry Font list new from the context menu. The new font list is displayed in the detail view of the Project Manager.

The default font is also automatically created in the first position here.

#### **ACTIVATING A FONT LIST:**

To activate a font list, click in the header for the desired font list and select the entry Font list in the Editor from the context menu. This can be necessary for language switchable texts. So you can check already in the Editor, how the element with the font will look in the Runtime. (e.g. whether the font is too large for a button) See chapter Language change / Fonts: Language switch / Fonts

#### Info

There is no default font list for Runtime. If several font lists are planned, the font list to be used in Runtime must be set using Language switching.

# 14.2 Default font and system font

Every new element is linked to a default font. This is the font that is assigned to the element type. Changing the property Font of an element causes that every new element of that element type is connected to this new font. After the editor is restarted, the default font is used for all element types again. The default font is Arial 10, supports antialiasing and is on the second position of the list.

The following fonts are automatically created when a project is first created:

Font	Font style	Size	Info
Arial	Standard	8	
Arial	Standard	10	Default font
Arial	Standard	12	
Arial	Standard	14	
Arial	Standard	20	

- ▶ The default font can be edited. The changes take effect everywhere where this font is linked.
- ► The system font is not scalable, which can lead to problems during zooming or when adjusting the resolution automatically.
- ► The default font can be changed via the Font property. The dialog is the same one that opens when New font is selected in the context menu.

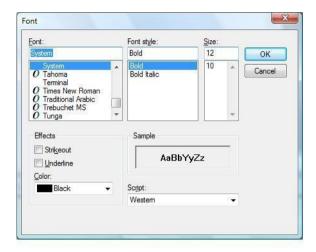

### 14.2.1 Creating a new font

One font list exists by default, which is displayed in the detail view of the Project Manager and can be filled with different fonts.

#### **CREATING A NEW FONT IN THE FONT LIST:**

Click in the window of the detail view and open the context menu with a right mouse click. Select the entry 'Font new' here.

The Windows dialog Font is opened. Here the following settings are available:

Parameters	Description
Font	All fonts of the operating system are sorted alphabetically
Font style	Bold, italic, etc.
Size	Font size in pixels
Effects	Underlined, strike-out
Color	Selection of the font color
Script	Western, Cyrillic, etc.

The color settings are ignored. Text is displayed in black unless the color has been explicitly edited in the properties Text colors only change in the Runtime (e.g. because of limit violations).

For fonts in global projects refer to chapter: Project administration / global project

#### Attention

All fonts used must be installed on all computers on which the project will be started. The installation can also be carried out with Remote Transport. See Define Files (Copy&Register)

#### 14.3 Naming and numbering fonts and font lists

When creating a zenon project, 5 default fonts (on page 274) are created. The name of the font list and the default font are dependent on the language in which the Editor was started. This applies for standard projects and global projects.

The fonts are given numbers. Number 1 and 2 are standard fonts. These two numbers cannot be changed, all other numbers can be adapted individually. When creating dynamic elements, this is automatically allocated to the font with number 2.

The Editor always has a font list actively switched. To use fonts from the standard project and the global project, the font lists in these two projects must be named the same.

Note: zenon projects that have been converted from version 5.50 into a later version have no default font list if the project has no fonts in 5.50.

#### **GLOBAL AND LOCAL**

Fonts from the local standard project have a higher priority than fonts from the global project. For example: There is a font with the number 50 in the global project. This font can be used in the workspace in any standard project as long as the standard project does not have a font with the number 50. If there is also a number 50 in the standard project, this font is used.

The fonts with the numbers 1 and 2 cannot be deleted in the standard project. That means: The fonts with the number 1 and 2 can be changed in the global project. However, they cannot be used in the standard project, because these two numbers are always present in the standard project and have a higher priority. An offset can be used to differentiate fonts from the global project and the standard project. For example, font 2 from the standard project can become font 2002 in the global project.

Workaround to use fonts 1 and 2 from the global project in the standard project: Delete the font list in the standard project and name a new empty font list the same as the font list in the global project.

#### **DELETE FONT LIST**

If the fonts with the numbers 1 and 2 from the global project are to be used in the standard project, the font list must be deleted in the standard project. To do this:

- 1. This is how you create a project backup:
- 2. If adapted fonts from a standard project are to be used globally:
  - a) Carry out an XML export of the font list from the standard project
  - b) Carry out an XML import of the font list into the global project
- 3. Open the SQL folder for the standard project

Hint: Highlight the project in zenon -> press Ctrl+Alt+E -> Explorer opens the project folder -> navigate on to zenon/system

- 4. close the workspace
- 5. Delete the file named fonts.bin
- 6. open the workspace
- 7. Now name an empty font list with the same name as the font list in the global project

Now the fonts with the numbers 1 and 2 from the global project are used in the standard project. New elements use the font with number 2 from the global project, if this is available, and the system font if the global project is not available.

#### **DYNAMIC AND STATIC**

Fonts for the static text vector element and for dynamic elements are saved differently. The reason for this: static text can also embed fonts.

Embedded means: The font is not linked to a font list, but is instead local and only configured for this element.

**Attention:** This does not mean that the font is embedded in the screen and is thus always displayed correctly. The font must continue to be present in the system that is displaying it.

#### IMPORT AND EXPORT VIA XML

When importing and exporting via XML, the Name property is used for identification with dynamic elements. If for example, in the global project there is a font with the name "zenon" and in the local

standard project there is another font that also has the name "zenon", then the font of the local project is used during import and export.

**Hint:** The font names must be clear in the global project and standard project. The Editor does not check this.

#### **VBA**

VBA uses the Number property of the font for dynamic elements. Here, the offset can be useful for fonts in the global project and in the standard project.

For example: Font 2 from the standard project is replaced by 2002 from the global project. For vector elements, the font number is saved in the second position of the font string. In the font string "0 7 0 0 700 255 0 0 0 3 2 5 34 Arial", the number of the font is 7 and can easily be replaced by 2007 from the global project.

## 14.4 Linking fonts to elements

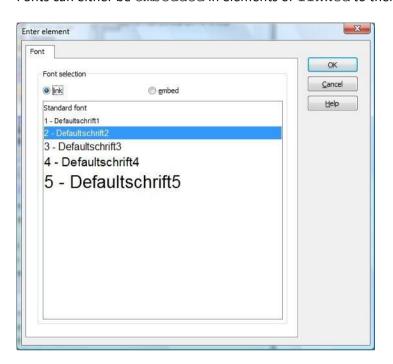

There are two possibilities to link a font to a dynamic or vector element (e.g. Text (on page 116)).

Parameters	Description	
Drag&Drop	The table in the detail view has the following structure: Numbers, font lists and fonts	
	After clicking the number of the desired font, it can be linked to the element with Drag&Drop.	
Properties	It is also possible to link the font in the properties of the selected element. Under 'Representation/Font' the dialog 'Enter element' is opened.	

### 14.4.1 Embedded and linked fonts

Fonts can either be embedded in elements or linked to them.

Parameters	Description
link	Fonts are linked by default.
embed	For the static text vector element, there is the possibility of embedding the font. The font is then no longer linked to a font list, but is instead local and only configured for this element.
	<b>Attention:</b> This does not mean that the font is embedded in the screen and is thus always displayed correctly. The font must continue to be present in the system that is displaying it.

# Info

### Scaling of symbols:

If the symbol contains a static text element and is embedded in this element as text, then this text.

- Is scaled in the Editor
- Is not scaled in Runtime

This only applies to symbols. Embedded text is neither scaled in the Editor nor in Runtime in all arrangements.

### 14.5 ClearType

ClearType fonts can improve the legibility of fonts on LCD screens in native resolution. Windows standard fonts are often better suited to CRT monitors and LCDs with an interpolated resolution. You can define whether ClearType fonts are used in the project properties: Nodes Graphical design -> Screens -> ClearType fonts.

#### **OPERATING SYSTEM DEPENDENT**

The effects that the option has also depends on the operating system used:

- ▶ Windows Vista or Windows 7:
  - If ClearType is active in the operating system, ClearType is used regardless of the setting in zenon.
    - Exception: DirectX can switch Cleartype on or off directly.
  - If ClearType is not active in the operating system, the setting in zenon is decisive.
- ▶ Windows XP:
  - The setting in zenon decides.

Setting	Settings of Graphics quality property	Description
Active (default)		ClearType fonts are used.
Inactive	Windows basic Windows extended	Windows standard fonts are used. Clear Type must also be deactivated in the operating system with Windows Vista and Windows 7.
	DirectX software DirectX hardware	Cleartype can be switched on or off regardless of the operating system

**Attention:** Changes in the setting only become effective after the Editor is restarted.

# 15. Symbols

Symbols are screen elements to which vector and dynamic elements are assigned as screen macros. The color attribute of a symbol can be changed by means of dynamic elements (binary element, multi-binary element and combined element) in Runtime.

zenon distinguishes between two symbol libraries:

Symbol library	Property	
Global system library	Symbols are available in all projects. The <b>Global symbol library</b> node is in the project manager below the currently-loaded projects	
	Global symbols are saved in the zenon program folder and only updated when the Editor starts. These symbols are not saved during project backup.	
Project Symbol Library	Symbols are only available in the current project.	
	The symbols are saved in the project folder. The project symbol library is in the current project in the Screens node and is backed up together with project backup.	

In order to be able to work with both libraries at the same time, the previews of the global library and the project library are displayed in two separate windows. In doing so, the names of the libraries are displayed in the tabs at the lower edge of the screen.

Symbols can be moved or copied from one library into the other with Drag&Drop.

# Info

### **Scaling of symbols:**

If the symbol contains a static text element and is embedded in this element as text, then this text:

- Is scaled in the Editor
- Is not scaled in Runtime

This only applies to symbols. Embedded text is neither scaled in the Editor nor in Runtime in all arrangements.

#### SCREEN SYMBOLS AND SYMBOLS FROM THE GLOBAL SYMBOL LIBRARY

- Screen symbols are created in the screen and can only be edited there. They are linked in the library or embedded in screens.
- Symbols from a library are edited in the library and linked in the screen.

### Attention

Symbols from the Global symbol library are saved locally in their own file (\*.sys) in the zenon program folder. These files must always be added manually to back-up the project with multi-user projects and when forwarding projects. Symbols from the local project symbol library are always contained automatically in project backups.

*Hint:* Always save symbols in the local project symbol library.

#### PROJECT MANAGER CONTEXT MENU

Menu item	Action
Export XML all	Exports all entries as an XML file.
Import XML	Imports from an XML file.
Open in new window	Opens a new window to view and edit the variable. (Default: at the bottom of the Editor.)
Help	Opens online help.

#### **CHECKING LINKED SYMBOLS**

Linked symbols are checked to see if they are present and correct:

- ▶ when the Runtime is compiled
- ▶ when the Editor is closed and new Runtime files are created

Missing symbols are marked red in the output window. The error message shows the name of the affected screens and symbols.

#### **MENU SYMBOLS**

As soon as a symbol is activated in the global symbol library or in the project symbol library, the Screens menu item is replaced by Symbol in the toolbar.

Possible actions are:

Menu item	Action	
Save symbol	Saves the current symbol.	
Save all symbols	Saves all symbols.	
Change symbol size / background color	Opens the dialog for configuration (on page 288) of symbol size and background color.	
	<b>Note:</b> Changes to the background color always affect all symbols in the global system library.	
List of symbols	Opens a list of all symbols, used in the current screen. For each symbol its graphical components are listed.	
Full screen mode	The full-screen hides all remaining windows and shows only the main window with all opened documents (screens, reports,) in full-screen mode.	
	The full-screen mode can be closed by:	
	<ul> <li>the displayed button for closing the full-screen mode</li> </ul>	
	► the short key Shift+F9	
	► the key Esc	
Redraw symbol	Refreshes the display.	
Display grid	Switches the grid on or off.	
Use grid	Switches usage of the grid on or off.	
	On: All objects are automatically aligned with the grid.	
Use magnetic points	Switches magnetic points on or off.	
	Use: If you move an object near the handling point of another object, it snaps in place at the handling point.	
Change order for focus	Opens drop-down list for definition of horizontal or vertical order for Keyboard operation.	
	Order for left/right: Determines the horizontal order.	
	Order for up/down: Determines the vertical order.	

Zooming	Changes the resolution in fixed steps between 15% and 400%.
Screenshot print current symbol	The current symbol is printed on the default printer. Set printer properties via File -> Standard configuration -> standard.
Insert vector graphics	Opens the dialog for inserting an external vector graphic.

# 15.1 Symbol detail view toolbar and context menu

The symbol library can be operated from the context menu or the toolbar:

### **COMMANDS IN THE CONTEXT MENU AND TOOLBAR**

Toolba r	Context menu	Function
1	Symbol new	Creates a new symbol.
3	Open symbol	Opens the symbol in the symbol editor for editing purposes.
2	Symbol group new	A new symbol group is created and can be filled with selected symbols from the library or with self-defined symbols. (Copy and Paste). Only available in the global symbol library.
4	Insert symbol as embedded symbol in the screen	Embeds the symbol in a screen (for details, see subchapter Embedded symbols (on page 296)).
5	Insert symbol as linked symbol in the screen	Links the symbol in a screen (for details, see subchapter Linked symbols (on page 297)).

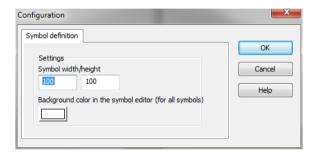

cilitates the search for
or delete symbols and it is ols from the clipboard.
oups and shows
board (only hierarchical
e group (only hierarchical
l group (only hierarchical
e!
ontents.
ement of texts (only were selected).
ne selected symbol.
ected node or all nodes in
e selected symbols. (For symbols.)
e chapter Import/Export of
nu.
nly toolbar).
enu:
e activated using the Menu

## 15.2 Configure size and background color

To configure the symbol size and background color:

- 1. Select the symbol in the context menu or in the, in the symbol menu, the Change symbol size/background color ... command
- 2. The dialog for configuration is opened

Parameters	Description
Symbol width/height	Input of the height and width of the symbol in pixels.
Background color	Defines background color. Clicking on Color opens the palette.  Note: Changes to the background color always affect all symbols in the global system library.
OK	Applies changes and closes dialog.
Cancel	Discards changes and closes dialog.

# 15.3 Release properties from link

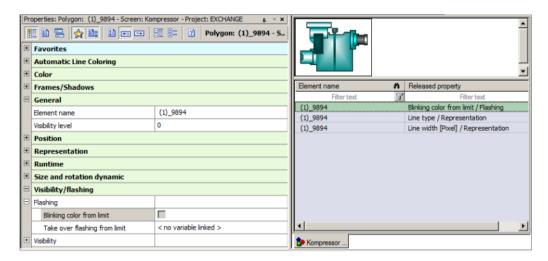

For optimum use of linked symbols, it is sometimes necessary to assign individual values to individual properties from system elements. For example, a motor symbol has a heading in which the name is contained.

You can release the Text property with this function. If the symbol is dragged onto the screen, the Text property can be changed individually for each motor.

This function is available for all properties.

#### **CONFIGURATION**

The symbol editor is opened when a symbol is opened. The symbol editor consists of a window divided into two parts to edit the selected symbol.

The symbol is edited in the upper area; in the lower area, the released properties of the element of this symbol are listed. You have different possibilities to release elements:

#### 1. Drag&Drop

- a) Move the desired properties by dragging & dropping from the property window in the lower area of the symbol editor.
- b) Note: You must always click on the name of the property (not the value) and move it into the release area by dragging & dropping.

### 2. Property context menu

- a) Right-click on the name of the property.
- b) Select Release [property] in the context menu
- c) The property is entered in the list

#### 3. <u>Property toolbar</u>

- a) Left-click on the name of the property.
- b) Click in the toolbar on the release symbol (green arrow upwards above text field)
- c) The property is entered in the list

**Note:** If the entry is not offered or the symbol is displayed as deactivated, the element cannot be released. Possible reasons:

▶ No screen element selected in the symbol editor

- Property was already released
- ► Element does not support release (ActiveX, for example)

The release area is a list that can be filtered. You can filter according to individual properties as needed. A context menu is available for all actions.

#### **CONTEXT MENU FOR RELEASE LIST:**

Parameters	Description
Remove selected property	Removes release of the element.
Undo	Revises last action.
Help	Opens online help.

#### **EDITING RELEASED PROPERTIES**

If the symbol is displayed in a screen, the additional node \$\_Element Name is available. All properties that have been released individually have been released. These are separated from the linking principle (released) and only concern this symbol if changed. If a property of one of the elements is selected in the Properties Window, this element flashes in the screen.

The released properties can be changed:

- ▶ With the properties in the \$\_element\_name branch
- with the Linked Symbol Wizard

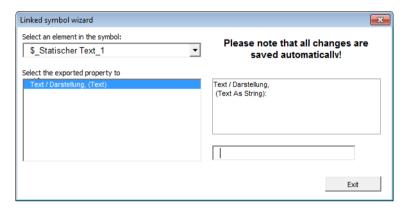

#### LINKED SYMBOL WIZARD

The linked symbol wizard is available to you in order to edit released properties easily and with a clear overview:

- 1. Double click on a symbol that:
  - a) Is linked in the screen and
  - b) has released properties
- 2. The Linked Symbol Wizard opens
- 3. Select the property to be changed

- Enter the new value
   Hint: Each change is accepted immediately!
- 5. Close the wizard by clicking on Exit

Parameters	Description
Select an element in the symbol:	Selection of an element in the symbol from the drop-down list.
Select the exported property to	Selection of the released property from a list.
Display of property	Display the property to be changed-
Input field	Input of the new value of the property by means of text entry/number entry, drop-down list or selection dialog - depending on the property.
Exit	Closes wizard

The wizard does not support all possible symbol properties.

# 15.4 Create and delete your own symbols

Create symbols either in the symbol editor or in a screen. Elements of a symbol can be:

▶ Vector Elements

- Dynamic elements
- other symbols: Symbols can be inserted into other embedded symbols

# Info

Elements contained in a symbol should only be placed within the symbol area and not jut out. If elements jut out over the symbol borders, artifacts may occur at the display in the Runtime. This is also true for elements using symbols (e.g. combi element).

#### IN THE SYMBOL EDITOR:

- 1. select New symbol in the context menu or in the tool bar
- 2. Click in the Element Name cell and assign a name (periods are not permitted in symbol names)
- 3. Create the symbol in symbol editor
- add any individual properties (see sub-chapter on releasing inherited properties (on page 288))
- save the symbol

#### ON THE SCREEN:

- 1. select one or more element on the screen
- 2. In the context menu, select Symbol -> Create Embedded Symbol (or -> Insert into Existing embedded Symbol)
  - or in the menu Edit-> Symbol -> Create Embedded Symbol
- 3. save the symbol

## Attention

Fonts and graphics in symbols for use throughout the project:

Fonts: fonts are defined through their ID. Ensure that the same ID is assigned to the desired font in all projects in which the symbol is used.

Graphics: Graphics embedded into a symbol are not saved with the symbol. The corresponding graphics must be copied manually to the graphics library of the corresponding project.

#### EMBED SYMBOLS INTO SYMBOLS OR LINK SYMBOLS TO SYMBOLS

You can also embed or link existing symbols when creating symbols in a similar manner to the screens (see Insert symbol into screen (on page 295)). In doing so, you must heed the following rules:

- A symbol may not contain any recursion i.e. it may not link to itself!
- Project symbols may not be linked across projects!
- Symbols from the global library may not contain any links to project symbols.

## Info

You can only edit the contents of symbols in the symbol editor. If you insert an embedded symbol into a screen, you cannot edit the symbol in the screen editor.

#### Attention

You can only link symbols from the project library within the respective project. It is not possible to link symbols from the project library across projects. To use a symbol from another project library in another project, you can embed it.

#### **DELETE OR REMOVE**

To delete a symbol:

1. highlight the symbol in the library

2. select Delete in the context menu or in the tool bar

To remove an embedded symbol in a new screen:

- 1. highlight the symbol in the library
- 2. In the context menu, select Symbol -> Remove
- 3. the symbol is removed in its elements
- 4. if the symbol for the symbol library has already been inserted, it remains there unchanged; it is deleted from symbol administration however

To delete a linked symbol:

- 1. highlight the symbol in the library
- 2. select Delete in the context menu.
- 3. the symbol remains unchanged in the symbol library, however it is deleted from symbol administration

To edit individual elements of a symbol without removing the symbol assignment, select:

- ▶ for linked symbols: Edit in symbol editor
- ▶ for embedded symbols: Single edit mode symbols / elements

### 15.4.1 Transfer own symbols to the library

You can also transfer symbols that you have created on the screen into a symbol library:

- 1. In the context menu, select the symbol Symbol -> Insert into symbol library
- 2. the dialog for symbol definition opens

- select your project library or the global symbol library and the appropriate folder
- 4. confirm the dialog with ox.
- change to the symbol library selected
- 6. the symbol was entered with the element name Embedded symbol No
- 7. name it as you wish
- 8. To continue editing the symbol or to allocate it individual properties(see Release Inherited Properties), (on page 288) open the symbol by double-clicking on it or via the Open symbol context command in the symbol editor

## Info

A symbol that was created from an element and a linked symbol cannot be accepted into the symbol library. To be able to insert the symbol:

- Convert the linked symbol into an embedded symbol
- Create a new symbol from the element and the embedded symbol

This symbol can now be inserted into the symbol library.

#### 15.5 Add symbols to screen

Symbols can be inserted into a screen in two ways, as

- Embedded Symbols (on page 296): These are no longer connected to the symbol in the library, changes to the original symbol have no effect on the embedded symbol.
- Linked Symbols (on page 297): These remain linked to the original symbol. Changes to the symbol also change the symbol in the screen.

#### Attention

You can only link symbols from the project library within the respective project. It is not possible to link symbols from the project library across projects. To use a symbol from another project library in another project, you can embed it.

## 💡 Info

If you have activated the Frame around dynamic elements in the Editor property, you can distinguish between embedded symbols and linked symbols at a glance. An arrow symbol is displayed in the upper right corner for linked symbols. You find this property under Options -> Settings in the Settings area.

#### 15.5.1 **Embedded symbols**

This is how you embed a symbol into a screen:

hold down the ctrl key and move it by dragging & dropping

or

select the Insert symbol as embedded symbol symbol in the context menu to embed the symbol into the current screen

Embedded symbols can then be resolved to their individual elements or their elements can be edited. To do this, select Symbol -> Change to individual editing mode in the context menu or Edit-> Symbol -> *Symbol/element individual editing mode in the menu.* 

These symbols do not change, if the original symbol in the library is changed, as they are no longer linked to it.

#### REPLACE LINKED VARIABLES

The dialog to replace variables and functions opens when embedding a symbol. Here, you can automatically replace the elements present with those you want for the linked symbol. You can find details on automatic replacement of variables and functions in the chapter on replacing variables and functions in dynamic elements (on page 225).

To replace variables in symbols that have already been inserted, select the Replace Links command in the context menu.

Hint: Ensure that the variables are named (on page 226) clearly and sensibly from the start.

## 15.5.2 Linked symbols

Linked symbols do not save variables that are physically present in the symbol library, only variable names. When inserting variables into a screen as a link, the variable names saved in the symbol can be assigned to variables from the project. If the project is given a variable that corresponds to a variable name saved in the symbol, this is linked automatically - without an extra rule.

#### **INSERTING A SYMBOL WITH LINKING**

This is how you link a symbol to a screen:

move the symbol by dragging & dropping it into the screen

or

 select the Insert symbol as linked symbol symbol in the context menu to link the symbol into the current screen

Linked symbols are only saved in the screen as links. Each change of the symbol in the library has a direct effect on the symbol on the screen. For example, if a dynamic element is added to a symbol, it is available in all screens in which the symbol is used.

Exception: Changes to the symbol size only have an effect on the screen of the symbol Original Size is selected in symbol properties Graphic size.

With embedded symbols, you can:

- turn them into embedded symbols: Context menu Symbol -> Convert Linked Symbol to Embedded Symbol
- ▶ Edit them in symbol editor: Symbol -> Edit in Symbol Editor
- insert them into an embedded symbol: Symbol -> Insert into Existing Embedded Symbol

Linked symbols cannot be resolved in their elements and their elements cannot be changed in Edit elements (context menu -> Symbol -> Change to individual editing mode mode or the Edit -> Symbol -> Symbol/element individual editing mode menu).

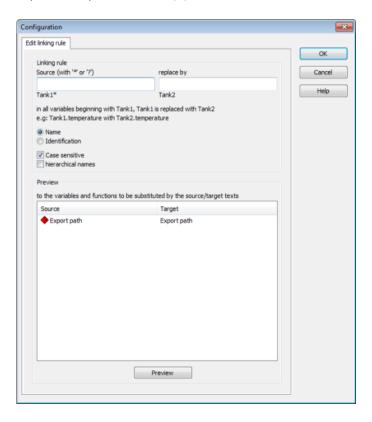

## Attention

With linked symbols, use only embedded fonts, because linked fonts are not scaled with the symbol. The position of the text would move in relation to the graphics in the symbol.

#### **REPLACE LINKED VARIABLES**

When embedding a symbol that contains variables, the dialog to replace variables and functions opens. Here, you can automatically replace the elements present with those you want for the linked symbol. ALC aliases that are die used in elements in the symbol can also be replaced. Several entries are separated by a semicolon (;).

Property	Description
Source	Entry of the partial string to be searched; wildcards * and ? are possible. (Wildcards are only allowed as prefix or suffix; e.g. *xxx or xxx*.)
Target	Entry of the partial string
Name	Swaps information in process variable names.
Identification	Exchanges information in the identification
Note capitalization	When swapping, be sure that any capitalization is an exact match.
Combined names	Permitted combined names.
	Is not available for ALC aliases. These are always used without a symbol prefix.

You can find further details on automatic replacement of variables and functions in the chapter on replacing linking of variables and functions (on page 225).

To replace variables in previously-inserted symbols, select the Preview property in the Linking rule node.

**Hint:** Ensure that the variables are named (on page 226) clearly and sensibly from the start.

#### **EXAMPLE:**

Source: A; b

Target: C; d

#### **COMBINED NAMES**

If the Hierarchical names property in the Linking rule node is active, the names of the linked variables from the object names of the symbol and the variables defined in the symbol are combined. The two names are separated by a dot: "symbolname.variable"

# **Example**

Variable name: Motor. Speed

The symbol object name is "Motor". The dynamic element that is used in the symbol has the placeholder "Speed" as a linked variable.

The placeholder "Speed" can be easily typed in for the symbol property when creating the variable.

Combined names also work with nested symbols:

If you have a "Pump" symbol, which in turn contains a "Motor" symbol and a "Convertor" symbol with the variable placeholder "Output", then the linking works if there is a Pump. Motor. Output variable and a Pump. Convertor. Output variable.

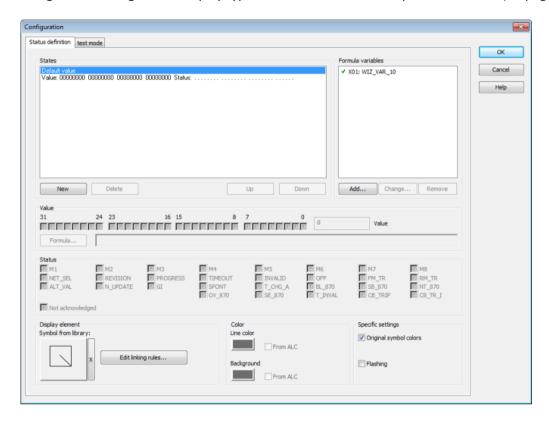

## 15.5.3 Symbol selection in the Combined element

To link combined elements with a symbol:

- 1. select symbol from library in the combined element properties in the Representation node in the Type of display property
- 2. click on Configuration and test
- 3. the configuration dialog opens:

The general settings for all display types can be found in the chapter on statuses (on page 63).

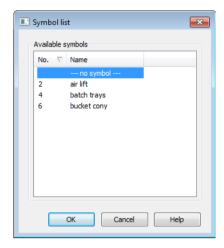

Parameters	Description
Display element	
Symbol from Library	Clicking on the symbol opens the dialog to select a symbol.
	Clicking on the X next to the symbol deletes the selected symbol.
Edit linking rule	Variables and functions contained in the symbol can be exchanged with the help of linking rules.
	<b>Attention:</b> If a variable or function does not fit into the scheme, that link cannot be replaced.
Colors	Only active if the Original Symbol Colors property in Specific Settings is turned off.
Color	Choice of color.
Filling color	Choice of filling color.
From ALC	The color of the linked source is used.
Specific settings	
Original Symbol Colors	Active: Transfers original color from symbol.  Deactivates Take color of main variable property.
Flashing	Active: Symbol flashes in runtime if status has been achieved.

## 15.6 Symbol list

You open a list that displays all symbols of the active screen via Edit-> Symbol -> Toolbar...:

Title	Contents
no.	Symbol number
Name	Name of the symbol

You sort the symbols according to number or name by clicking on the respective column title. A symbol selected in the list of symbols is blinking in the screen.

# 15.7 XML export and XML import

Import/export of symbols is possible from the project and the global symbol library. Single or selected symbols or the entire library can be imported or exported. The path for the export can be defined freely.

#### **EXPORT SYMBOLS**

To export symbols:

- 1. highlight the desired symbols
- select Export selected XML... in the context menu of the detail view
   Alternatively: select, in the context menu of the Project symbol library node, the XML export all... command

- 3. the selection dialog for the saving location is opened
- 4. select the desired saving location
- 5. assign a name
- 6. pay attention to file type XML
- 7. confirm by clicking on the Save button

The selected symbols are exported to an XML file and can be imported in this or in other projects at any time

#### **IMPORT SYMBOLS**

To import symbols:

- 1. in the context menu of the node or the detail view of the Project symbol library or in the detail view of the Global symbol library select Import XML... command
- 2. the selection dialog for the saving location is opened
- 3. navigate to the saving location of the desired XML file
- 4. Select the desired file
- 5. confirm the import by clicking on the open button

The symbols are imported.

#### NAME CONFLICTS DURING THE IMPORT

At the import of a symbols the name (attribute **ShortName**) which is stored in the XML file is used for the name of the symbol which is created. If a symbol with the same name already exist, the import is halted and an error message is displayed:

Parameters	Description
Yes	The symbol described in the error message is replaced by the symbol from the XML file at the import. If a new conflict occurs, the error message is displayed again.
No	The symbol described in the error message is not imported. The existing symbol is maintained. If a new conflict occurs, the error message is displayed again.
Yes, all	The symbol described in the error message is replaced by the symbol from the XML file at the import. This setting is used automatically when errors due to using the same name occur. All affected symbols are replaced.
No, all	The symbol described in the error message is not imported. The existing symbol is maintained. This setting is used automatically when errors due to using the same name occur. All affected symbols are maintained.

**Note:** Only the **shortName** is used. The file name does not matter for the name of the symbol which should be imported. Thus it cannot be used to solve the conflict.

# 16. Visibility levels

Similar to CAD programs, you can define visibility levels in the Editor and allocate them with unique elements. That way you can easily hide unused elements in complex images and show them again anytime. 15 visibility levels are available. Levels are allocated using the properties Visibility level in the nodeGeneral. Unique levels can be activated and deactivated using the buttons of the toolbar Visibility levels:

Symbol	Function
(from left to right)	
Show all visibility levels	Shows all levels.
Hide all visibility levels	Hides all levels.
Visibility level <no.></no.>	Shows / hides the relevant visibility level.
Symbol bar options	Clicking on the arrow opens the submenu:
	Active: Toolbar is displayed.
	If the toolbar is not displayed, it can be activated using the Menu <i>Options -&gt; Toolbar</i> .

Visibility levels only apply to the Editor and have no effect in Runtime.

Note on control elements: Control elements are always displayed at the uppermost position. That also applies if they are covered by other elements in the Editor. This ensures that they can always be reached.

# 17. Screen types

Screens are created in the basic setting with the Standard screen type. A drop-down list can be used to select special screen types for the properties in the screen properties.

### Attention

If a type is changed from a standard type to a special type, the new screen type is fixed with the screen and can no longer be changed.

#### **SPECIAL SCREEN TYPES**

zenon offers a range of special screen types (on page 307) for special tasks. After selecting a special screen type, all user elements for the respective screen type are available in the Control elements menu. Menu item add template (on page 310) opens a selection dialog for adding pre-defined layouts with certain control elements at pre-defined locations.

## Info

Special screen types need only be created once, even when used multiple times. They can be opened with different data by means of the screen switching function.

#### SPECIAL SCREEN TYPES AS A START SCREEN

Each screen type can also be used as a start screen in theory.

Attention: Special screen types are opened with an empty filter and thus no data are opened.

#### **Special screen types** 17.1

Special screen types in zenon:

Screen type	Description
Alarm Message List	Collects alarm messages and displays them in list form.
Alarm Message List Filter	filter for the Alarm Message List.
Archive revision	Display of saved archive values in a table and editing of these
	ATTENTION: Only available if the Historian is licensed.
Batch	Creating defaults for master recipe in module Batch Control.
	ATTENTION: Only available if Batch Control is licensed.
Command input	Display of command inputs.  ATTENTION: Only available if the Energy Edition is licensed.
Chronological Event List	Collects process events, system events and user defaults and displays them in list form.
Chronological Event List Filter	Filter for the Chronological Event List
Energy Management System	planning and display of energy use management (electricity, gas).
	ATTENTION: Only available if the Energy Management System is licensed.
	Note: Not available under Windows CE.
Extended Trend	Displays online and archive values as diagrams.
Peak Load Projection	Screen for the display of Peak Load Projection
	ATTENTION: only available if SICAM 230 is licensed.
HTML (on page 349)	Makes it possible to display a screen in HTML, customized for Microsoft Internet Explorer.
Industrial Maintenance Manager	Display of maintenance information.  ATTENTION: Only available if the Industrial Maintenance Manager is licensed.
	Note: Not available under Windows CE.
Industrial Performance Analyzer	Analyzes alarms in order to localize weak points (downtime) of equipment.
	Note: Not available under Windows CE.
Keyboard	Creates a freely definable virtual keyboard.

Login	Individual design of a login window.
Message Control	Screen for managing the message queu in Message Control.
Notebook (on page 352)	Displays protocols and text files which were created from database requests or existing text files.
Production & Facility	Administrates schedules and profiles.
Scheduler	ATTENTION: Only available if the Production & Facility Scheduler (PFS) is licensed.
Report Generator	For the output of reports that are produced by means of the extended Report Generator.
	ATTENTION: Only available if the Report Generator is licensed. If you only want to display reports but not edit them, you do not need a license for Runtime.
Report Viewer	Serves to display RDL reports for Archive, AML, CEL and online values.
	ATTENTION: only available if reporting is licensed.
Recipegroup Manager	Administrates recipes and their use within a recipe group.
	<b>ATTENTION:</b> Only available if the Recipegroup Manager (RGM) is licensed.
S7 graph	is used for sequential chains with alternative or parallel step sequences (SFC). Displays the current status of chain control in the PLC in runtime.
Standard recipes	Administrates recipes
Variable diagnosis	Displays variables in Runtime and sends set values to the hardware
	Note: Not available under Windows CE.
Video (on page 355)	Displays online and saved videos (*.avi).
	Note: Not available under Windows CE.
Worldview Overview	Makes it possible to scroll standard screens which are larger than the screen resolution.
Time filter	Enables general filter settings to be set for lists. The lists that are controlled by this are defined in the screen switching function.
	·

#### 17.1.1 Create special screen types

To create a special screen type:

- 1. create a new screen or select an existing screen of the type Standard
- 2. click on the predefined Standard type in the properties in the Screen type at General node

Alternatively: In the screen detail view, click on the screen type of the elements and select the desired screen type from the drop-down list

- 3. Select the desired screen type from the drop-down list.
- 4. select the desired control elements in menu control elements
  - Add template (on page 310) opens a selection dialog for adding pre-defined layouts with certain control elements at pre-defined locations.
  - Elements that are already present on the screen are displayed in gray and can no longer be selected

## Info

Limitation for automatic insertion of the template:

If there is already a static element, such as a control element, in the screen, no frame or frame text is inserted when inserting the default control elements.

Recommendation: Insert, after creating a special screen type in the first stage, the default control elements from the template and then further elements.

#### 17.1.2 Template for standard screens and special screen types

For special screen types and also for standard screen you can use templates for automatic inserting and positioning elements. Templates can be created from every screen by yourself. For special screen types pre-defined templates are shipped with zenon.

Templates are stored as compressed zip files which include three files:

Meta data: XML file with the description of the template (name, description, size, etc.).

- ▶ Screen elements: XML file with the exported elements of the screen.
- ▶ Preview: Bitmap file with a preview of the template.

#### SHIPPED TEMPLATE

The shipped templates are available in different resolutions and also optimized for touch screens. These templates cannot be changed or deleted. Pre-defined templates by COPA-DATA are saved in the program folder under: \Templates\ScreenTypes\<name of the screen type>\<file name>.zip.

#### **USER-DEFINED TEMPLATE**

Users can create and save templates for all screen types. They can also be edited and deleted.

User-defined templates are saved in the zenon data folder: Templates\ScreenTypes\<name of screen type>\<file name>.zip.

 $e.g.: \ensuremath{\$}\COPA-DATA\zenon700\Templates\ScreenTypes\Alarm \\ Message List\3e9afbcf-f93d-46d9-a199-e00effe4811c.zip.$ 

**Note:** The path depends on whether it is registered at the installation or via the Startup Tool. If the latter is the case, the current program folder is used as data folder.

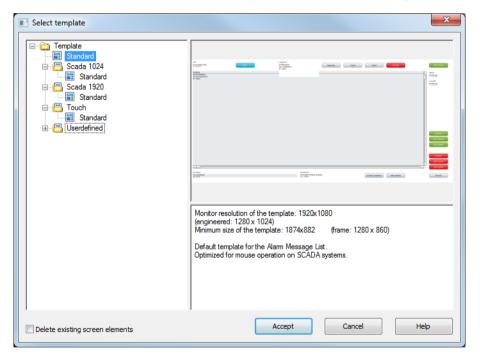

## **Use templates**

To use templates for a screen:

- 1. open the screen
- 2. select Add template in the control element menu
- 3. the dialog fir selecting pre-defined and user-defined templates is opened

Note: for screen of type Standard only user-defined template are available

- 4. select the desired templates
- 5. Click on Accept
- 6. the elements defined in the templates are inserted at the pre-defined location

Parameters	Description
List field templates (left)	Zeigt alle vordefinierten und benutzerdefinierten Vorlagen an.
Preview to template (top right)	Preview of the screen at taking over the selected template.
Description template (bottom right)	Description of the template.
Delete existing screen elements	Active: Already existing elements in the screen are deleted when taking over the template.
Accept	Inserts the elements of the selected template in the screen and closes the dialog.
Cancel	Closes dialog without inserting elements.
Help	Opens online help.

### **Create templates**

Folders and template can be newly created, deleted, renamed and moved for user-defined templates. Shipped, pre-defined templates cannot be changed or deleted.

#### **CREATE FOLDER OR TEMPLATE**

To create a folder, select:

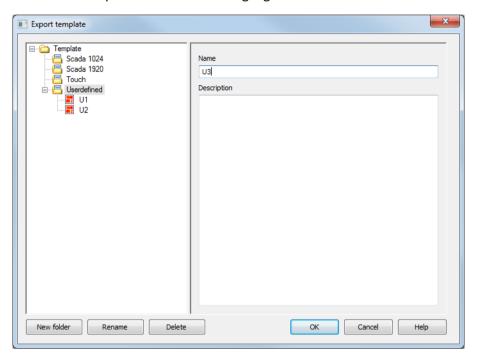

- ▶ button **New** folderin the dialog
- ▶ or command New folder in the context menu
- ▶ or use the Ins key

To create a template:

- 1. highlight the desired screen in the detail view
- 2. select command create template for screen type in the context menu or in the tool bar
- 3. the dialog for creating own templates is opened
- 4. select an existing folder or create a new one

- 5. enter a name for the new template
- 6. you can add a description as an option
- 7. confirm this with ox.
- 8. the template is added to the highlighted folder

Parameters	Description
List field templates (left)	Displays all pre-defined and user-defined template.
	Makes it possible to delete or rename folder and templates and to add folders via the context menu.
Preview to template (top right)	Preview of the screen at taking over the selected template.
Description template (bottom right)	Description of the template.
New folder	Creates a new folder. You can create several levels.
Delete	Deletes the selected folder with all subfolders after a confirmation request.
OK	Create template and closes dialog.
Cancel	Closes the dialog without creating the template.
Help	Opens online help.

#### **DELETE FOLDER**

To delete a folder or a template:

- 1. highlight the folder or template
- 2. select
  - a) button Delete in the dialog
  - b) or command Delete in the context menu
  - c) or use the Del key

The folder or template is deleted after a confirmation request. For folders possible subfolders including all their templates are also deleted.

#### **RENAME FOLDER OR TEMPLATE**

To rename a folder or a template:

- ▶ Select the Rename command in the context menu
- or highlight the element and open the label for renaming by pressing F2.
- ▶ or at templates change the text in filed Name

### **MOVE FOLDERS OR TEMPLATES**

Folders and template can be moved via drag & drop with the help of the mouse to other folders.

### Context menu create template for screen type

In the dialog for creating new template context menus are also available.

### **CONTEXT MENU FOR FOLDER**

Parameters	Description
New folder	Creates a new folder below the highlighted level.
Delete	Deletes the highlighted folder after a confirmation message.
Rename	Opens the folder caption for renaming.
Help	Opens online help.

#### **CONTEXT MENU FOR TEMPLATES**

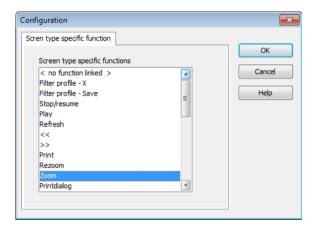

Parameters	Description
Delete	Deletes the highlighted template after a confirmation message.
Rename	Opens the template caption for renaming.
Help	Opens online help.

## 17.2 Screen-specific functions

If a dynamic element of the Button type is created in a screen with a special screen type, Variable / functionactivates additional propertyScreen type specific function is available in properties in the nodes. Therefore the button can be assigned special functions, appropriate to the screen type.

For example, in extended trend:

## 17.3 Screen filter

The screen filter dialog is displayed using the screen switch function on an Alarm Information List, Chronological Event List or Time Filter screen, .

With the screen filters, you have the possibilty to comfortably create individual filter pages. You do not have to use the pre-defined zenon dialogs for this; you can compose your own filter dialogs instead. You can do this according to aspects such as touch operation, filtering of special areas only, ability to switch languages, etc.

### 17.3.1 Screen filter dialog

You can make basic adjustments in this dialog. These settings influence the values that are displayed when the attendant filter screens are switched on during runtime.

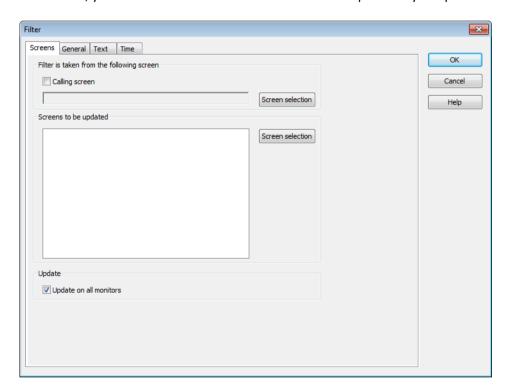

Not all tabs are available for all screen filter types.

### Screens

On this tab, you can define the screens which are to be updated by the picture filter.

The following settings are available:

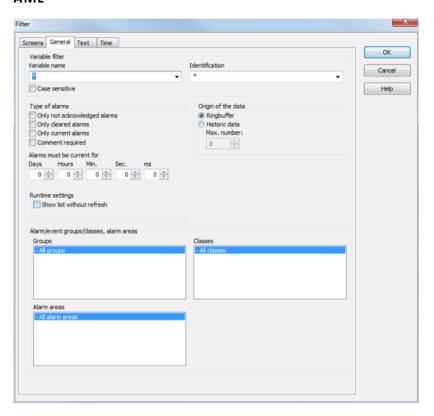

Parameters	Description
The filter is taken from the following screen	
Calling screen	Active: The filter settings are take over from the screen from which the filter screen is called up. The screen button is grayed out. You cannot explicitly select a screen, because the filter is always updated from the calling screen with this setting.  Note: Settings in the General, Text and Time tabs are locked.
Screen selection	Click on button opens the Screen selection dialog.
	Select the screen from which the filter - when clicking button Update during Runtime - should be read.
	<b>Note:</b> It therefore only makes sense to select a screen which can adopt or fill the screen filter.
	The screen selected is entered into the list of screens to be updated. If you delete it from the list, the next screen on the list is automatically entered here.
	Note: Not available if you have activated the Calling screen checkbox.
Screens to be updated	
Screen selection	Click the button to open dialog Screen selection of the filter screens. Select the desired screen.
Updating	
Update on all monitors	Active: The screens from the list of the screens which must be updated are updated on all accessible monitors.

### General

This tab is only available for the Alarm Message List and Chronologic Event List and shows the standard filter for the respective list. See Alarm Message List filter and Chronological Event List filter.

### **AML**

Parameters	Description	
Variable filter	Limitation to alarms of certain variables	
Variable name	Enter the name or part of the name of the variable you want to filter. Use of a wildcard * is possible.	
	<b>Hint:</b> Wildcards are only allowed as prefix or suffix; e.g. *xxx or xxx*.	
Identification	Enter the identification or partial identification of variables according to which you would like to filter. Use of a wildcard * is possible.	
	<b>Hint:</b> Wildcards are only allowed as prefix or suffix; e.g. *xxx or xxx*.	
Note capitalization	Active: Upper and lower case is only taken into account when filtering for variable name and/or identification.	
Alarm type	Type of alarm that is displayed.	
Only unacknowledged alarms	Active: Only alarms that have not yet been acknowledged by the user are displayed.	
Only historical alarms	Active: Only alarms that have already passed, i.e. whose values no longer in the critical range, are displayed.	
Only current alarms	Active: Only alarms that are still active, i.e. whose values are still in the critical range, are displayed.	
Alarms must at least be active	Use the spin control to define the minimum time that an alarm should be active in order for it to be displayed.  Possible settings:	
	▶ Days	
	▶ Hours (hr.)	
	▶ Minutes (min.)	
	▶ Seconds (sec.)	
	▶ Milliseconds (ms)	
Origin of the data	Display of current or current and historical alarms.	
Ring buffer	Active: Only data from the ring buffer is displayed.	
Historic data	Active: Data from the ring buffer and historical data	

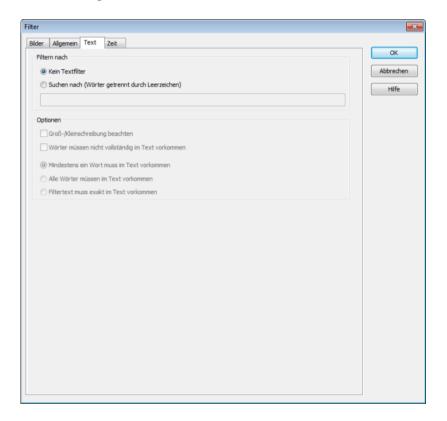

Maximum number	from the AML are displayed.  The maximum amount of data to be displayed includes the data from the ring buffer.
Runtime settings	Behavior of the AML in Runtime
Show list without refresh	Active: No new entries are added as long as the list is displayed.
Alarm/event groups/classes, alarm areas	Selection of groups, classes and alarm areas
Alarm/event groups	Select, from the alarm/event groups present, the one from which alarms are to be displayed.
Alarm/event classes	Select, from the alarm/event classes present, the one from which alarms are to be displayed.
Alarm areas	Select, from the alarm areas present, the one from which alarms are to be displayed.

#### Text

You can define the standard values for text filtering on this tab. Only available for Alarm Message List and Chonological Event List.

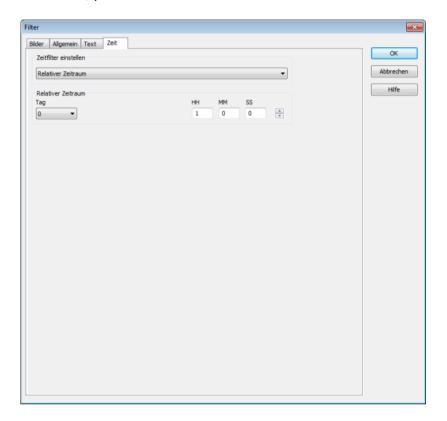

Parameters	Description
Filter according to	
No text filter	The text filter is not used.
Search for (words separated by	The text filter filter is used.
spaces)	Further options are activated.
Input field	Enter the corresponding words or character strings.
Options	
Note capitalization	Active: A distinction is made between upper case and lower case when filtering.
Words do not have to appear in the text in full	Active: Parts of words can also be taken into account during filtering.
At least one word must be present in the text	Active: At least one word of the search string has to be in the text.
All words must be present in the text	Active: All words must be present in the search string. In doing so, the sequence plays no role.
Filter text must appear in the text exactly	Active: The text must be exactly as defined in the search string.

## Time

On this tab, you can define the time area which is to be used when the filter screen is opened.

The following settings are available:

Parameters	Option s	Description
Absolute period of time		A fixed period of time is entered in the editor. When the function is executed, the defined absolute time period is exactly used.  Example: If you want to see all alarms from January 1, 2011 to December 31, 2011, then you must enter the corresponding data at From and To.  Note: Time is saved in UTC. For details see chapter Handling of date and time in chapter Runtime.
	From	Defines the start time in day, month, year, hour (HH), minute (MM), second (SS)
	То	Defines the end time in day, month, year, hour (HH), minute (MM), second (SS)

Relative time		A relative time period is entered.
period		Attention! this filter is constantly updated. It is therefore carried over.
		For example: You set up a relative time of 10 minutes and switch to an Alarm Message List Screen with this time filter at 12:00. Then you are shown the alarms from 11:50 to 12:00 when switching. If the Alarm Message List screen stays open, the filter is automatically updated. At 12:01, you see the alarms from 11:51-12:01 etc.
	Time	Defines the relative period in days, hours (HH), minutes (MM) and seconds (SS)
from HH:MM:SS o' clock		A time from which the filter is effective is stated. If the time is not reached on the current day, filtering takes place from the corresponding time the previous day.
		Example: You enter 23:00:00. If it is then 23:30 when executing the function, then it is filtered from 23:00:00 up to the current point in time. If it is 22:30 however, then filtering takes place from 23:00:00 on the previous day to the current point in time.
		Attention! The start point of this filter is not updated automatically. Only the existing times are used when shown, even if the screen remains open and 23:00:00 is reached.  The end time point is not defined with this filter, it is carried over.
	Time	Defines the start time period in hours (HH), minutes (MM) and seconds (SS)
From day - HH:MM:SS time		A day and time for the start of the filter are entered. If the time given has not been reached in the current month, the corresponding time from the previous month is used.
		Example: You enter day $5 - 23:00:00$ . If it is the 10th of the month at 23:30, then filtering takes place from the 5th of the month from 23:00:00 to the current time point. If, however, it is the 4th of the month, then filtering takes place from the 5th of the previous month to the current time point.
		Attention! The start time of this filter is not updated automatically. Only the existing times are used when shown, even if the screen remains open and 23:00:00 is reached.
		The end time point is not defined with this filter, it is carried over.
	Time	Defines the start point in hours (HH), minutes (MM), seconds (SS)

From day, month - HH:MM:SS time		A month, day and time for the start of the filter are entered. If the time stated has not been reached in the current year, the corresponding time from the previous year is used.
		Example: You enter Month October, Day 5-23:00:00. If it is October 10th at 23:30, then filtering takes place from October 5th from 23:00:00 to the current time point. If, however, it is only October 4th, then filtering takes place from the 5th of the previous year to the current time point.
		Attention! The start point of this filter is not updated automatically. Only the existing times are used when shown, even if the screen remains open and 23:00 on October 5 is reached.  The end time point is not defined with this filter, it is carried over.
	Time	Defines the start point in months, days, hours (HH), minutes (MM), and seconds (SS)
No time filter		No time filter is used.

## 17.3.2 Creating an Alarm Message List filter screen

It is possible to adjust filter settings for the Alarm Message List in Runtime with the help of the Alarm Message List Filter screen. Only the filter elements that are actually required are configured and provided to the user The appearance can also be freely defined and thus adapted to different end devices. All filter settings that are available in the filter for the function to switch the screen to the Chronological Event List screen can be configured.

#### Therefore:

- ▶ Only the filter elements that are actually required are configured and provided to the user
- The user only has these filters displayed and has an overview
- ► The appearance can be freely defined and can, for example, ensure ease of use by means of a touch screen.

For details of use in Runtime, see Using the Alarm Message List Filter chapter.

For the definition of filter criteria, see Filter Alarm Message List Filter chapter.

Screens of type Alarm Message List Filter, Chronological Event List Filter and Time Filter must be engineered with an own frame. If they use the same frame as other screens, all screens based on this frame are closed when the screen is closed.

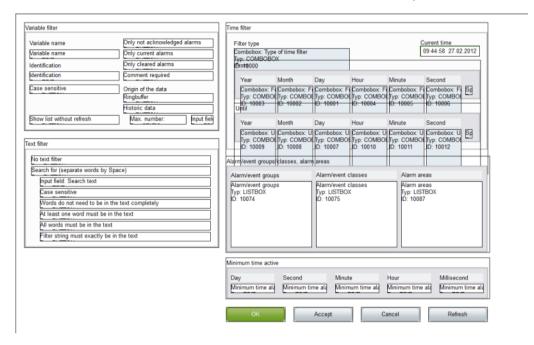

#### CREATING AN ALARM MESSAGE LIST FILTER SCREEN

To create an Alarm Message List filter screen:

- 1. Select, in the toolbar or in the context menu of the screens node, the New Screen command
- 2. An standard empty screen is opened
- 3. Change the screen type in the detail view; to do this:
  - a) Click On Standard in the Screen type Column
  - b) Select Alarm Message List filter from the drop down list
- 4. Select your own template (AML filter cannot be based on the same template as other screens)
- 5. Click in the screen.
- 6. Select the control elements menu item in the menu bar
- 7. Click on Add template (on page 310) in the drop-down list
- 8. the dialog for selecting a template is opened
- 9. select the desired template
- 10. Select additional elements as required and insert them into the desired place on the screen

## **ELEMENTS**

The Alarm Message filter screen can contain the following control and display elements.

Element	Description
Add template	Opens the dialog for selecting a template (on page 310) for the screen type.
	Templates are shipped together with zenon and can also be created by the user.
	Templates add pre-defined control elements to pre- defined locations in the screen. Elements that are not necessary can also be removed individually once they have been created. Additional elements are selected from the drop-down list and dragged onto the screen. Elements can be moved on the screen and arranged individually.
General filter	Drop-down list of different general filters.
Insert all elements: General filter	Inserts all elements from the area of general filters into pre-defined places. Elements can be arranged individually.
Variable filter	Alarms of which variables are displayed:
▶ Variable name	Filter according to names of variables.
▶ Identification	Filter according to identification of variables.
▶ Note capitalization	Note capitalization when filtering the variables.
Alarm type	Which alarms are displayed:
▶ Only unacknowledged alarms	Only unacknowledged
▶ Only historical alarms	Only historical
▶ Only current alarms	Only current
▶ Comment required	Alarms that require a comment when acknowledged
▶ Minimum time for current alarms - days	Only alarms that have been current for at least the given number of days.
<pre>Minimum time for current alarms - hours</pre>	Only alarms that have been current for at least the given number of hours.
▶ Minimum time for current	Only alarms that have been current for at least the given number of minutes.

alarms - minutes	
Minimum time for current alarms - seconds	Only alarms that have been current for at least the given number of seconds.
▶ Minimum time for current alarms - milliseconds	Only alarms that have been current for at least the given number of milliseconds.
Origin of the data	Where does the data come from:
▶ Ring buffer	From the ring buffer.
▶ Historical data	From an archive.
▶ Labeling: Maximum number	Text for Maximum number input field
▶ Input field: Maximum number	Input of the maximum alarms to be displayed when historical alarms are displayed.
	0: displays all
Runtime settings	
▶ Show list without refresh	Switches the AML in stopped state. New alarms are not added.
Alarm/event groups/alarm/event classes/alarm areas	List field for grouped display:
▶ Alarm/event groups	Alarm/event groups
▶ Alarm/event classes	Alarm/event classes
▶ Alarm areas	Alarm areas

Time filter	Drop-down list of different time filters (on page 325).
Insert all elements: Absolute time period - classic display	Inserts all elements for the definition of absolute time periods: Each element contains its own field.
Insert all elements: Absolute time period - small display	Inserts elements for the definition of absolute time periods in compact display.
Insert all elements: Relative time period	Inserts all elements for the definition of relative time periods.
Insert all elements: From HH:MM:SS o' clock	Inserts all elements for the definition of "from" time points in hours-minutes-seconds format.
Insert all elements: From day - HH:MM:SS time	Inserts all elements for the definition of "from" time points in day-hours-minutes-seconds format.
<pre>Insert all elements: From day, month - HH:MM:SS time</pre>	Inserts all elements for the definition of "from" time points in day-month-hours-minutes-seconds format.
Labeling: Time filter type	Labeling for time filter type.
Combobox: Time filter type	Combobox time filter type
Display: Time filter type	Field for time filter type display.
Time from	Fields and labeling for stating "from" time.
▶ Labeling: From year	
▶ Combobox: From year	
▶ Labeling: From month	
▶ Combobox: From month	
▶ Labeling: From day	
▶ Combobox: From day	
▶ Labeling: From hour	
▶ Combobox: From hour	
▶ Labeling: From minute	
▶ Combobox: From minute	
▶ Labeling: From second	

▶ Combobox: From second	
▶ Spin control: From	
Time to	Fields and labeling for stating "to" time.
▶ Labeling: To year	
▶ Combobox: To year	
▶ Labeling: To month	
▶ Combobox: To month	
▶ Labeling: To day	
▶ Combobox: To day	
▶ Labeling: To hour	
▶ Combobox: To hour	
▶ Labeling: To minute	
▶ Combobox: To minute	
▶ Labeling: To second	
▶ Combobox: To second	
▶ Spin control: To	
Absolute time filter	Fields and labeling for stating absolute time filter.
▶ Labeling: From	
▶ Calendar display: From date	
▶ Date display: From date	
▶ Time display: From time	
▶ Labeling: To	
▶ Calendar display: To date	
▶ Date display: To date	

▶ Time display: To time	
Text filter	Drop-down list of different text filters (on page 323).
Insert all elements: Text filter	Inserts all elements for text filters.
No text filter	Radio button to deselect text filter.
Search for (words separated by spaces)	Radio button to activate the search
Labeling: Search text	Labeling for search field.
Input field: Search text	Field for input of search term.
Options	Search options
▶ Note capitalization	Capitalization must be noted.
▶ Words do not have to appear in the text in full	Fragments can also be searched for.
At least one word must be present in the text	At least one search term from several must be in the result.
▶ All words must be present in the text	All search terms must be included in the result.
Filter text must appear in the text exactly	Exact text from the input field must be contained in the result.
OK	Accept inputs and close screen.
Cancel	Reject inputs and close screen.
Accept	Accept inputs and leave screen open for further inputs.
Refresh	Refresh screen.

## **FILTER SCREENS**

Filter screens make it possible to transfer a preset filter from one screen to another. The filter of the source screen is set using the target screen. The screens can also be of a different screen type.

If a different time period than Set filter for time filter type is selected for the Alarm Message List or the Chronological Alarm List, the time of the screen to be called up cannot be transferred over in Runtime.

#### **CALL DEFINITION**

The following requirements must be met for the set filters to be used:

- 1. Set filter for time filter type is selected as a time period for the time filter.
- 2. The Screen (Alarm Message List Filter, Chronological Event List filter Of Time Filter screens) are activated using a button or a combined element. Only in this way can the relationship between filter screen and source screen be maintained.
- 3. The source screen and filter screen must be configured on different frames or monitors. The filter for the filter screen can only be updated if the source screen is open. This is only possible if both screens do not use the same frame or the same monitor.
- 4. The screen to be called up must be compatible with the filter screen to be called up (see table).

Source screen	AML filter	CEL filter	Time filter
Archive revision	Т	Т	Т
Extended Trend	Т	Т	Т
Time filter	Т	Т	х
Alarm Message List Filter	Х	С	Т
Chronological Event List Filter	С	X	Т
Alarm Message List	Х	С	Т
Chronological Event List	С	Х	Т

#### Key:

- C: Common settings are updated.
- T: Time settings are updated.

X: All settings are updated.

## Info

#### No filtering

The filter screen is not filtered, but opened with the configured values, if:

- One of the conditions 1 to 3 is not met or
- The Screen to call up setting is not activated for the Screen switching function
- The screen is not called up via a screen element

In this case, the Accept, Close and Update buttons are grayed out in Runtime and have no function.

#### 17.3.3 Create a screen of the type CEL Filter

It is possible to adjust filter settings for the Chronological Event List in Runtime with the help of the Chronological Event List Filter screen. Only the filter elements that are actually required are configured and provided to the user The appearance can also be freely defined and thus adapted to different end devices. All filter settings that are available in the filter for the function to switch the screen to the Chronological Event List screen can be configured.

#### Therefore:

- Only the filter elements that are actually required are configured and provided to the user
- The user only has these filters displayed and has an overview
- The appearance can be freely defined and can, for example, ensure ease of use by means of a touch screen.

For details of use in the Runtime, see Using the CEL Filter chapter.

For the definition of filter criteria, see Filter screen switch CEL Filter chapter.

Screens of type Alarm Message List Filter, Chronological Event List Filter and Time Filter must be engineered with an own frame. If they use the same frame as other screens, all screens based on this frame are closed when the screen is closed.

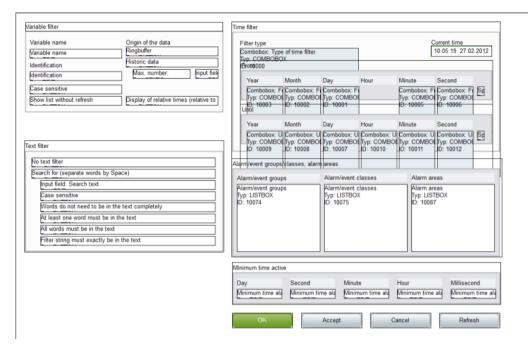

#### CREATE A SCREEN OF TYPE CHRONOLOGICAL EVENT LIST FILTER

To create a screen of type Chronological Event List Filter:

- 1. Select, in the toolbar or in the context menu of the screens node, the New Screen command
- 2. An standard empty screen is opened
- 3. Change the screen type in the detail view; to do this:
  - a) Click On Standard in the Screen type Column
  - b) Select Chronological Event List Filter from the drop-down list
- 4. select your own frame (CEL filter cannot be based on the same frame as other screens)
- 5. Click in the screen.
- 6. Select the control elements menu item in the menu bar
- 7. Click on Add template (on page 310) in the drop-down list
- 8. the dialog for selecting a template is opened
- 9. select the desired template
- 10. Select additional elements as required and insert them into the desired place on the screen

#### **ELEMENTS**

The screen of type Chronological Event List Filter can contain the following control and display elements.

Element	Description
Add template	Opens the dialog for selecting a template (on page 310) for the screen type.
	Templates are shipped together with zenon and can also be created by the user.
	Templates add pre-defined control elements to pre- defined locations in the screen. Elements that are not necessary can also be removed individually once they have been created. Additional elements are selected from the drop-down list and dragged onto the screen. Elements can be moved on the screen and arranged individually.
General filter	Drop-down list of different general filters.
Insert all elements: General filter	Inserts all elements from the area of general filters into pre-defined places. Elements can be arranged individually.
Variable filter	Alarms of which variables are displayed:
▶ Variable name	Filter according to names of variables.
▶ Identification	Filter according to identification of variables.
▶ Note capitalization	Note capitalization when filtering the variables.
Origin of the data	Where does the data come from:
▶ Ring buffer	From the ring buffer.
▶ Historical data	From an archive.
▶ Labeling: Maximum number	Text for Maximum number input field
▶ Input field: Maximum number	Input of the maximum alarms to be displayed when historical alarms are displayed.
	0: displays all
Runtime settings	
▶ Show list without refresh	Switches the AML in stopped state. New alarms are not added.
▶ Display relative time	Switches between the normal display and the relative-time display without the entries losing focus.

	Relative time: All entries are displayed in the time distance to the selected entry.  The displayed time is the difference time passed since the selected entry. The selected entry automatically gets the time stamp 0. The other events have a:  • positive time difference to the selected entry if they occurred later  • negative time difference to the selected entry if they occurred earlier
Alarm/event groups/alarm/event classes/alarm areas	List field for grouped display:
▶ Alarm/event groups	Alarm/event groups
▶ Alarm/event classes	Alarm/event classes
▶ Alarm areas	Alarm areas

Time filter	Drop-down list of different time filters (on page 325).
Insert all elements: Absolute time period - classic display	Inserts all elements for the definition of absolute time periods: Each element contains its own field.
Insert all elements: Absolute time period - small display	Inserts elements for the definition of absolute time periods in compact display.
Insert all elements: Relative time period	Inserts all elements for the definition of relative time periods.
Insert all elements: From HH:MM:SS o' clock	Inserts all elements for the definition of "from" time points in hours-minutes-seconds format.
Insert all elements: From day - HH:MM:SS time	Inserts all elements for the definition of "from" time points in day-hours-minutes-seconds format.
Insert all elements: From day, month - HH:MM:SS time	Inserts all elements for the definition of "from" time points in day-month-hours-minutes-seconds format.
Labeling: Time filter type	Labeling for time filter type.
Combobox: Time filter type	Combobox time filter type
Display: Time filter type	Field for time filter type display.
Time from	Fields and labeling for stating "from" time.
▶ Labeling: From year	
▶ Combobox: From year	
▶ Labeling: From month	
▶ Combobox: From month	
▶ Labeling: From day	
▶ Combobox: From day	
▶ Labeling: From hour	
▶ Combobox: From hour	
▶ Labeling: From minute	
▶ Combobox: From minute	
▶ Labeling: From second	

▶ Combobox: From second	
▶ Spin control: From	
Time to	Fields and labeling for stating "to" time.
▶ Labeling: To year	
▶ Combobox: To year	
▶ Labeling: To month	
▶ Combobox: To month	
▶ Labeling: To day	
▶ Combobox: To day	
▶ Labeling: To hour	
▶ Combobox: To hour	
▶ Labeling: To minute	
▶ Combobox: To minute	
▶ Labeling: To second	
▶ Combobox: To second	
> Spin control: To	
Absolute time filter	Fields and labeling for stating absolute time filter.
▶ Labeling: From	
▶ Calendar display: From date	
▶ Date display: From date	
▶ Time display: From time	
▶ Labeling: To	
▶ Calendar display: To date	
▶ Date display: To date	

▶ Time display: To time	
Text filter	Drop-down list of different text filters (on page 323).
Insert all elements: Text filter	Inserts all elements for text filters.
No text filter	Radio button to deselect text filter.
Search for (words separated by spaces)	Radio button to activate the search
Labeling: Search text	Labeling for search field.
Input field: Search text	Field for input of search term.
Options	Search options
▶ Note capitalization	Capitalization must be noted.
▶ Words do not have to appear in the text in full	Fragments can also be searched for.
At least one word must be present in the text	At least one search term from several must be in the result.
▶ All words must be present in the text	All search terms must be included in the result.
Filter text must appear in the text exactly	Exact text from the input field must be contained in the result.
OK	Accept inputs and close screen.
Cancel	Reject inputs and close screen.
Accept	Accept inputs and leave screen open for further inputs.
Refresh	Refresh screen.

## **FILTER SCREENS**

Filter screens make it possible to transfer a preset filter from one screen to another. The filter of the source screen is set using the target screen. The screens can also be of a different screen type.

If a different time period than Set filter for time filter type is selected for the Alarm Message List or the Chronological Alarm List, the time of the screen to be called up cannot be transferred over in Runtime.

#### **CALL DEFINITION**

The following requirements must be met for the set filters to be used:

- 1. Set filter for time filter type is selected as a time period for the time filter.
- 2. The Screen (Alarm Message List Filter, Chronological Event List filter Of Time Filter screens) are activated using a button or a combined element. Only in this way can the relationship between filter screen and source screen be maintained.
- 3. The source screen and filter screen must be configured on different frames or monitors. The filter for the filter screen can only be updated if the source screen is open. This is only possible if both screens do not use the same frame or the same monitor.
- 4. The screen to be called up must be compatible with the filter screen to be called up (see table).

Source screen	AML filter	CEL filter	Time filter
Archive revision	Т	Т	Т
Extended Trend	Т	Т	Т
Time filter	Т	Т	х
Alarm Message List Filter	Х	С	Т
Chronological Event List Filter	С	X	Т
Alarm Message List	Х	С	Т
Chronological Event List	С	х	Т

#### Key:

- C: Common settings are updated.
- T: Time settings are updated.

X: All settings are updated.

# Info

#### No filtering

The filter screen is not filtered, but opened with the configured values, if:

- One of the conditions 1 to 3 is not met or
- The Screen to call up setting is not activated for the Screen switching function
- The screen is not called up via a screen element

In this case, the Accept, Close and Update buttons are grayed out in Runtime and have no function.

#### Time filter screen 17.3.4

It is possible to make changes to time filter settings during runtime via the time filter screeen. The following screens can be influenced by the filter:

- Alarm Message List
- Archive revision
- ► Chronological Event List
- **Extended Trend**

The advantage of this type of screen is that only the filter elements that are actually necessary can be configured. Therefore the user does not need to get to grips with numerous filter settings. Only the filter settings that he needs are displayed. Furthermore, you are completely free to change the appearance and can, for example, ensure ease of use by means of a touch screen.

Screens of type Alarm Message List Filter, Chronological Event List Filter and Time Filter must be engineered with an own frame. If they use the same frame as other screens, all screens based on this frame are closed when the screen is closed.

In the time filter screen, all time filter settings that are also present in the filter for the function to switch screens to the appropriate screen can be projected.

#### **FILTER SCREENS**

Filter screens make it possible to transfer a preset filter from one screen to another. The filter of the source screen is set using the target screen. The screens can also be of a different screen type.

#### Attention

If a different time period than Set filter for time filter type is selected for the Alarm Message List or the Chronological Alarm List, the time of the screen to be called up cannot be transferred over in Runtime.

#### **CALL DEFINITION**

The following requirements must be met for the set filters to be used:

- 1. Set filter for time filter type is selected as a time period for the time filter.
- 2. The Screen (Alarm Message List Filter, Chronological Event List filter Of Time Filter screens) are activated using a button or a combined element. Only in this way can the relationship between filter screen and source screen be maintained.
- 3. The source screen and filter screen must be configured on different frames or monitors. The filter for the filter screen can only be updated if the source screen is open. This is only possible if both screens do not use the same frame or the same monitor.
- 4. The screen to be called up must be compatible with the filter screen to be called up (see table).

Source screen	AML filter	CEL filter	Time filter
Archive revision	Т	Т	Т
Extended Trend	Т	Т	Т
Time filter	Т	Т	х
Alarm Message List Filter	Х	С	Т
Chronological Event List Filter	С	X	Т
Alarm Message List	Х	С	Т
Chronological Event List	С	х	Т

## Key:

- ► C: Common settings are updated.
- ► T: Time settings are updated.
- ► X: All settings are updated.

## 💡 Info

### No filtering

The filter screen is not filtered, but opened with the configured values, if:

- One of the conditions 1 to 3 is not met or
- ▶ The Screen to call up setting is not activated for the Screen switching function or
- ▶ The screen is not called up via a screen element

In this case, the Accept, Close and Update buttons are grayed out in Runtime and have no function.

#### **UPDATING**

When a filter screen is called up (Alarm Message List filter, Chronological Event List filter, time filter), the screens configured in the screen switching function are updated in two ways:

- ▶ If the filter screen is called up via a screen element, the target screens on the same monitor as the source screen are updated.
- ► If the filter is called up in a different way or if the Update on all monitors setting is activated, all target screens configured are updated.

They are updated as soon as you click the Accept button or as soon as you closes the filter screen with the close close button. The Cancel button discards the changes and closes the filter screen.

#### **UPDATE FILTER SETTINGS**

You update the current filter settings for the source screen using the <code>vpdate</code> button. If the filter screen is not called up by a screen element or if the <code>Calling screen</code> has not been activated, all monitors are searched for screens that can be used for updating. The first screen that is found is then this is used for updating.

#### 17.4 **HTML**

Makes it possible to display a screen in HTML. The currently installed Microsoft Internet Explorer is used as rendering engine.

## 17.4.1 Creating a screen of the type HTML

In order to create screen HTML:

- 1. create a new screen
- 2. select HTML as screen type
- 3. an empty screen is created
- 4. Click on Add template (on page 310) in the drop-down list
- 5. the dialog for selecting a template is opened
- 6. select the desired template

Addresses for the navigation and the search are defined when function Screen switch (on page 349) is created.

## Info

The menu item Add template adds pre-defined control elements to pre-defined locations in the screen. All control elements can be added, deleted and freely positioned. Other dynamic elements and vector elements can also be added.

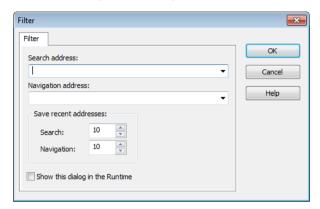

#### 17.4.2 Function Screen switch - HTML

In order to create a function to switch to the screen HTML:

- select New function
- select screen switch

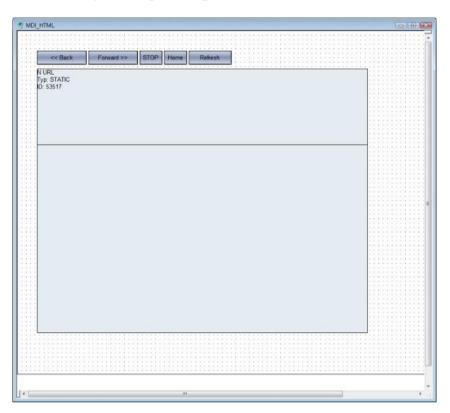

- ▶ select the screen HTML (on page 349)
- ▶ a dialog for defining the addresses for the search and navigation area is opened

Parameters	Description
Search address	Address of the page, that should be displayed in the search area.
Navigate address	Address of the page, that should be displayed in the navigate area.
Save recent addresses	
Find	Number of addresses, that should be stored by the system for the search area.
Navigation	Number of addresses, that should be stored by the system for the navigate area.
Show this dialog in the Runtime	Active: Opens the dialog when the screen is opened in the Runtime.

# 17.4.3 Operating during Runtime

Control element	Description
Find	Search area element
Navigate	Navigation area element When clicking a link in the field 'search', the according page will be displayed in the field 'Navigate'. So e.g. in the field 'search' a navigation bar or the results of a search engine can be displayed without changing the contents, when a link is activated.
Search Back	Page up in the search area.
Search Forward	Page down in the search area.
Cancel search action	Cancel search action.
Search Home	Back to home in the search area.
Search Refresh	Refresh search area.

Search URL	Search for address or file.
Navigate Back	Page up in the navigation area.
Navigate Forward	Page down in the navigation area.
Cancel navigate action	Cancel navigate action.
Navigate Home	Back to home in the navigation area.
Navigate Refresh	Refresh navigation area.
Navigate URL	Navigate to address or file.
Filter	Open filterbox.

## 17.5 Notebook

With the notepad you can display text files and (optionally) edit them.

## 17.5.1 Creating screen Notepad

The display size of the screen Notepad is taken from the frame size (on page 242). The file which is opened must be determined during the definition of the Screen switch (on page 353).

In order to create a Notepad:

- 1. create a new screen
- 2. select Notepad as screen type
- 3. an empty screen is created
- 4. Click on Add template (on page 310) in the drop-down list
- 5. the dialog for selecting a template is opened
- 6. select the desired template

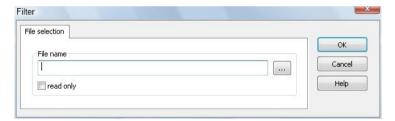

Add template adds pre-defined control elements to pre-defined locations in the screen. All control elements can be added, deleted and freely positioned. Other dynamic elements and vector elements can also be added.

# 17.5.2 Function screen switch to Notepad

In order to create a function to switch to the screen Notepad:

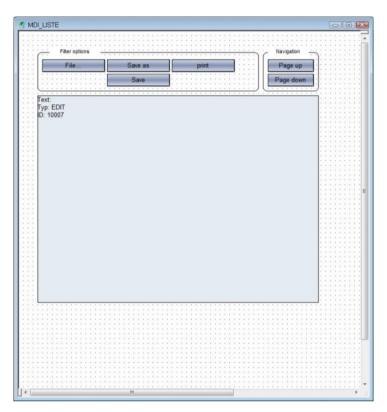

- ▶ select New function
- ▶ select screen switch
- ▶ select the screen Notepad (on page 352)
- ▶ a dialog for defining the file which should be displayed is opened

Parameters	Description
File name	Selection of the file which is to be displayed Click on and a dialog is opened. The file must have already been created in node file/notepad. If no appropriate file has been created, you can select on in the dialog using symbol Add file. Allowed file types: TXT, HTM, HTML, FRM.
Read only	Active: In the Runtime the text can only be read but not edited.

# 17.5.3 Operating during Runtime

Control element	Action
Button file	File selection in online operation
Button refresh	Refresh display in online operation
Button save	Save changes in online operation to file
Button save as	Save changes to a file with a different name
Button print	Print report in online operation
Button print dialog	Printer settings
Button close	Close alarm information list
Button column left	Scroll text in list element to the right
Button column right	Scroll text in list element to the left
Button page left	Scroll text in list element to the right
Button page right	Scroll text in list element to the left
Button line up	Scroll text in list element up
Button line down	Scroll text in list element down
Button page up	Scroll text in list element up
Button page down	Scroll text in list element down
Text element	Display window of the text list

## **17.6** Video

Online and stored video recordings can be displayed in zenon by using a screen for the representation of videos. The format used is .avi.

In the Runtime videos are centered in the frame when displayed. The control is carried out using control element.

**Note:** The codecs needed to play back the video must be installed on the computer.

## 17.6.1 Creating a screen of the type Video

In order to create screen Video:

- 1. create a new screen
- 2. select Video as screen type
- 3. an empty screen is created
- 4. Click on Add template (on page 310) in the drop-down list
- 5. the dialog for selecting a template is opened
- 6. select the desired template

Add template adds pre-defined control elements to pre-defined locations in the screen.

All control elements can be added, deleted and freely positioned. Other dynamic elements and vector elements can also be added.

#### 17.6.2 Screen switch - video

With screen Video you can display two types of videos in the Runtime:

- 1. saved videos (\*.avi)
- 2. Videos of a surveillance camera

Which video is shown depends on which tab was shown when you saved the dialog.

If video files and online video should be displayed, create to screen switch functions.

In order to create a function to switch to the screen Video:

▶ select New Function

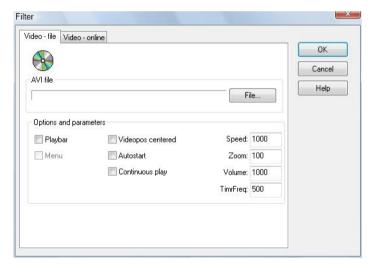

- select screen switch
- ▶ select the screen Video (on page 356)
- ▶ a dialog for the definition of the video source opens.
  - Video file (on page 357)
  - Video online (on page 358)

#### Video file

The parameters needed for the display of screen video for showing a surveillance camera are the following:

- Set the video which should be shown
- Settings for position, speed, volume and zoom factor of the display

Parameters	Description
AVI-file	Saved video file to be displayed
Options and parameters	
Playbar	Display of a slider in the video screen.
Menu	Display of a menu in the playbar for operating the video (only possible with activated playbar)
Videopos center	Reference point for the position of the video display in zooming actions.  Active: The zoomed video is placed in the center of the frame.  Inactive: The video display is zoomed to bottom right.
Auto start	Video file is automatically started when opening the screen
Continuous play	Video file is restarted after each end.
Speed	Speed in thousandth of the original speed.  Default: 1000 (original speed)
Zoom	Zoom factor for enlarging and reducing the original size in percent while obtaining the correct aspect ratio. Default: $100$ (original size)
Volume	Speed in thousandth of the original volume.  Default: 1000 (original volume)
TimrFreq	Note: Is currently not used.  Timer frequency.  Default: 500

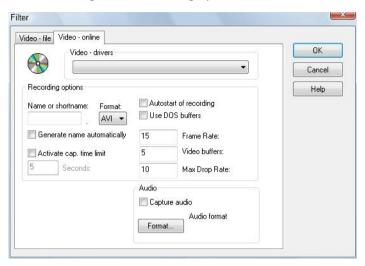

## Video online

The parameters needed for the display of screen Video for showing a surveillance camera are the following:

► Setting of the video driver

Setting of the recording options if the video should be recorded

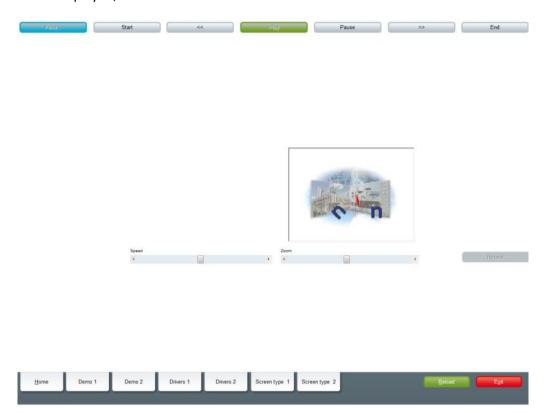

Parameters	Description
Video - drivers	Selection of the video driver used.
	Note: the driver should support Microsoft Capturing.
Record options	Options for the recording and saving of the video as an AVI-file or Bitmaps.
	If only online video should be displayed, there are no settings needed.
Name or abbreviation	Name of the file to be saved.
Automatic assignment	Name is automatically generated from the system time during recording.
Activate cap. time limit	Time limit for the recording in seconds.
Format	AVI or BMP.
Auto start of the recording	Recording is automatically started when the screen is displayed.
Use DOS buffers	Only relevant for 16-bit systems.
Frame Rate	Number of pictures per second for recording
Video buffers	Reserved buffer for video recording in MB
Max Drop Rate	Maximum amount of "drooped frames" in percent during recording.
	Value: 0 to 100
	Default: 10
Video	Driver specific settings.
Views	Setting depends on the selected driver.
Format	Setting depends on the selected driver.
Compress	Setting depends on the selected driver.
Source	Setting depends on the selected driver.
Audio	Settings for the sound recording
Capture audio	Activates the sound recording.
Audio format	Driver specific settings.

# 17.6.3 Operating during Runtime

When displayed, the videos are centered in the frame.

Control element	Description
Video online	Elements for controlling an online video.
Format	Output format
Source	Data source
Display	Video display
Compression	Data compression.
Video file	Elements for controlling a video file.
Speed	Speed.
Zoom	Zoom.
Filters	Filter settings.
Start	Play video.
Replay	Play video again.
Record	Record video.
Pause	Stop video during playback.
Pause/Resume	Pause playback/resume playback.
Eject	Eject.
>>	Fast forward.
<<	Fast reverse.
End	Forward to the end of the video.
Pos1	Rewind to the beginning of the video.

# **18. Screen Functions**

When the standard function is created from the context menu in the detail view, <CD\_PRODUCTNANE> creates a function 'screen switch' for the selected screen.

### 18.1 Screen switch

The screen switch function makes it possible to switch between process screens in runtime

In a project, there is a Start screen and a screen of type Alarm Message List. During runtime, it should be possible to switch between these two screens. So, for example, a button is created in the Start screen and a function of type screen switching in the Alarm Information list screen. After this, the function is linked to the button, for example by dragging & dropping. Now during runtime, the Start screen can be left by pressing the button and the Alarm Message List can be switched on.

#### **CONFIGURE SCREEN SWITCHING**

To configure the function:

- 1. Create a new function
- 2. navigate to node Screens
- 3. Select the Screen switch function
- 4. The dialog for selecting a screen is opened
- 5. Select a screen
- 6. The dialog to replace variables and functions (on page 225) is opened
- 7. Close the dialog by clicking on OK
- 8. Allocate a button to the function

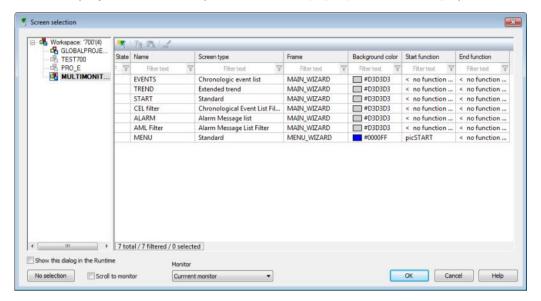

### **SCREEN SELECTION DIALOG**

In the screens selection dialog, screens can be selected for the execution of functions from:

- Current project
- ▶ Subprojects

All projects in the workspace with the Keep project in memory option active

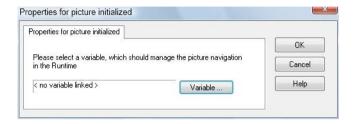

Parameters	Description
Project tree window	Displays all projects in the workspace. Screens can be selected from the current project and from all projects with the Keep project in memory option active
Screens window	Selection of the screen.
	If several screens are selected, the first selected screen is used for the execution of the function.
Show this dialog in the Runtime	Switches to this screen selection dialog when this function is executed in Runtime.
No selection	Has no function for this screen selection.
Scroll to monitor	Active: Scroll bars are shown in Runtime, which make it possible to scroll to the monitor.
	Only available with multi-monitor systems.
Monitor	Selection of the monitor from the drop-down list.
	This contains:
	Current monitor
	All virtual monitors defined in the monitor administration
	▶ optional: All monitors
	Only available with multi-monitor systems.
	Only available with multi-monitor systems.
OK	Applies settings and closes dialog.
Cancel	Discards all changes and closes dialog.
Help	Opens online help.

### 18.2 Index screen

This function is used to switch to the screen with the name stated in the linked string variable.

A string variable is to be selected from the list of variables as a transfer parameter.

**Note for multiple-monitor systems:** It is not possible to select monitors. The function always relates to the first monitor.

### 18.3 Close screen

A defined screen in Runtime is closed with this screen. If, with a multiple-monitor projects, a screen is switched to several monitors, it is possible to select which screen is closed on which monitor.

To configure the function:

- 1. Select, in the list of functions, in the Screens node, the Close screen function
- 2. The dialog for selecting a screen is opened
- 3. select the desired picture
- 4. Select, with multiple-monitor projects, the virtual monitor on which the screen is to be closed from the drop-down list:
  - all objects
  - Current monitor
  - Designated virtual monitor

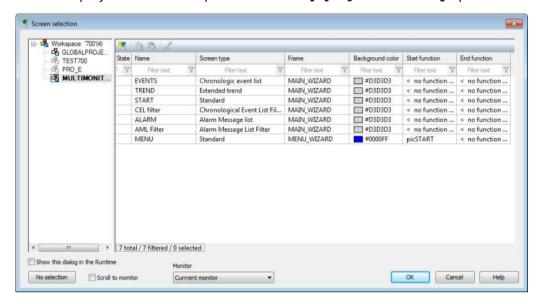

#### **SCREEN SELECTION DIALOG**

In the screens selection dialog, screens can be selected for the execution of functions from:

Current project

- ▶ Subprojects
- ▶ All projects in the workspace with the Keep project in memory option active

Parameters	Description
Project tree window	Displays all projects in the workspace. Screens can be selected from the current project and from all projects with the Keep project in memory option active
Screens window	Selection of the screen.
	If several screens are selected, the first selected screen is used for the execution of the function.
Show this dialog in the Runtime	Switches to this screen selection dialog when this function is executed in Runtime.
No selection	Has no function for this screen selection.
Scroll to monitor	Active: Scroll bars are shown in Runtime, which make it possible to scroll to the monitor.
	Only available with multi-monitor systems.
Monitor	Selection of the monitor from the drop-down list.
	This contains:
	Current monitor
	All virtual monitors defined in the monitor administration
	▶ optional: All monitors
	Only available with multi-monitor systems.
	Only available with multi-monitor systems.
OK	Applies settings and closes dialog.
Cancel	Discards all changes and closes dialog.
Help	Opens online help.

## 18.4 Screen back

This function reverts to the screen previously open in Runtime during online operation. In doing so, the same function that is used to to open the screen is executed once again. This means that screen filters are not saved but have to be recreated.

The screens that were previously open are stored in a buffer. By executing the Screen switching function, the screens of the corresponding frames (on page 242) are stored in the memory. The number of screens in the memory is configured in the project.ini file.

[FUNKTIONEN]

ZURUECK\_ANZAHL=10

The frames have to be given as a transfer parameter.

The amount of memory must be given with the ZURUECK ANZAHL= entry.

**Note for multiple-monitor systems:** It is not possible to select monitors. The function always relates to all monitors.

## 18.5 Focus: Activate input to the element with the focus

This function activates the element that is being focused on in the frame selected.

## 18.6 Set focus to template

This function sets the focus to a defined frame when operating the keys in runtime.

To configure the function:

- 1. Select, in the list of functions, in the Screens node, the Set focus to frame function
- 2. The dialog for selecting a screen is opened
- 3. select the frame you wish to assign
- 4. For multi-monitor projects, select the virtual monitor for opening the frame

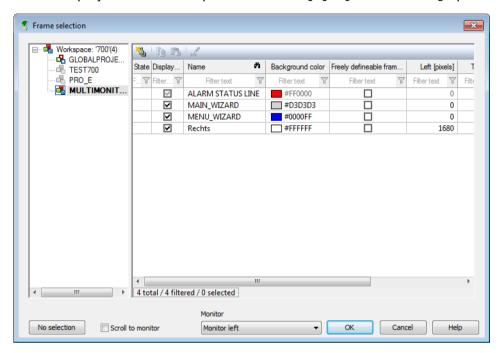

The frame with a focus is displayed with a frame in runtime. The line width and color of the frame are defined in the Graphical design/Screens node in project properties.

#### FRAME SELECTION DIALOG

In the Frame selection dialog, frames can be selected for the execution of functions, from:

- ▶ Current project
- ▶ Subprojects
- ▶ All projects in the workspace with the Keep project in memory option active

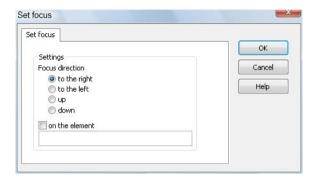

Parameters	Description
Project tree window	Displays all projects in the workspace. Frames can be selected from the current project and from all projects with the Keep project in memory option active
Frames window	Selection of frame.
	If several frames are selected, the first selected frame is used for the execution of the function.
Show this dialog in the Runtime	Switches to this frame selection dialog when this function is executed in Runtime.
No selection	Has no function for this selection.
Scroll to monitor	Active: Scroll bars are shown in Runtime, which make it possible to scroll to the monitor.
	Only available with multi-monitor systems.
Monitor	Selection of the monitor from the drop-down list.
	This contains:
	Current monitor
	All virtual monitors defined in the monitor administration Optional: All monitors
	Only available with multi-monitor systems.
OK	Applies settings and closes dialog.
Cancel	Discards all changes and closes dialog.
Help	Opens online help.

## 18.7 Move focus

This function set the focus on a particular element in runtime with keyboard operation and can therefore be used to navigate within a frame.

Property	Action
Direction	Define the direction in which the focus should be moved. The following defined sequence applies in the editor in the context menu or under <i>Edit/change focus sequence</i>
on the element	Definition of the element for the focus. Enter the object name of the element.

## 18.8 Focus: Delete from frame

This function takes the focus from the current frame in runtime. To continue operating the keyboard, the focus must be set to a frame again.

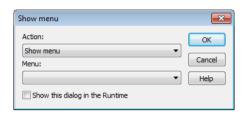

### 18.9 Show menu

This function controls the display of main menus.

- 1. Create a new function with New function
- 2. In the screens node, select the Display menu function

3. Define the action to be carried out and the main menu

Parameters	Description
Action	Selection of the action:
Show menu	The selected menu is displayed.
Hide menu	The selected menu is hidden.
Change menu	The current menu is hidden and the selected menu is displayed instead.
If no menu exists	The selected menu is displayed, if no menu is displayed at the moment.
Menu	Selection of menu.
Show this dialog in the Runtime	Active: This dialog is opened when the function is carried out in Runtime.

## 18.10 Monitor assign

In a multi-monitor-environment you can assign a certain virtual monitor to a single real monitor.

## 18.11 Close template

With this function, the selected frame (on page 242) with all screens that are based on it are closed. In contrast to the Close screen (on page 366) function, the precise screen name need not to be given in this case. If, with a multiple-monitor projects, a frame is switched to several monitors, it is possible to select which frame is closed on which monitor.

To configure the function:

- 1. Select, in the list of functions, in the Screens node, the Close frame function
- 2. The dialog for selecting a screen is opened
- 3. select the frame you wish to assign
- 4. Select, with multiple-monitor projects, the virtual monitor on which the frame is to be closed, from the drop-down list:
  - all objects
  - Current monitor
  - Designated virtual monitor

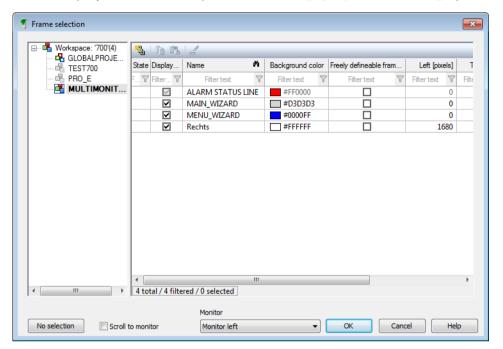

### FRAME SELECTION DIALOG

In the Frame selection dialog, frames can be selected for the execution of functions, from:

- Current project
- Subprojects

▶ All projects in the workspace with the Keep project in memory option active

Parameters	Description
Project tree window	Displays all projects in the workspace. Frames can be selected from the current project and from all projects with the Keep project in memory option active
Frames window	Selection of frame.
	If several frames are selected, the first selected frame is used for the execution of the function.
Show this dialog in the Runtime	Switches to this frame selection dialog when this function is executed in Runtime.
No selection	Has no function for this selection.
Scroll to monitor	Active: Scroll bars are shown in Runtime, which make it possible to scroll to the monitor.
	Only available with multi-monitor systems.
Monitor	Selection of the monitor from the drop-down list.  This contains:
	Current monitor
	All virtual monitors defined in the monitor administration Optional: All monitors
	Only available with multi-monitor systems.
OK	Applies settings and closes dialog.
Cancel	Discards all changes and closes dialog.
Help	Opens online help.

## 18.12 Set point input for keyboard screen

The Setpoint input for keyboard screen function is not available for the keyboard screen. In addition the text field Set value must have been created. It makes it possible to set or set and send a previously defined value.

Parameters	Description
Set point default	Input of the target value.
Action	Selection of action from drop-down list. (for possible actions, see the following table.)
ОК	Accepts inputs, closes dialog and creates functions with value and action.
Cancel	Discards inputs, closes dialog and creates functions without setpoint and action.
Help	Opens online help.

Actions in the drop-down list:

Action	Description	
propose value	The setpoint default is written to the keyboard screen.	
Accept value	The following happens:	
	the set value default is written to the keyboard screen	
	The keyboard screen is closed with OK	
RGM: Accept and send value	If the keyboard screen is called up from the Recipe Group Manger recipe table, then:	
	The setpoint default is written to the keyboard screen	
	The keyboard screen is closed with OK	
	The recipe value is written to the variable	
RGM: Accept value and save recipe	If the keyboard screen is called up from the Recipe Group Manger recipe table, then:	
	The setpoint default is written to the keyboard screen	
	▶ The keyboard screen is closed with OK	
	▶ The recipe is saved	
RGM: Write and send value and save recipe	If the keyboard screen is called up from the Recipe Group Manger recipe table, then:	
	The setpoint default is written to the keyboard screen	
	The keyboard screen is closed with OK	
	The recipe value is written to the variable	
	▶ The recipe is saved	

# 18.13 Display overview window

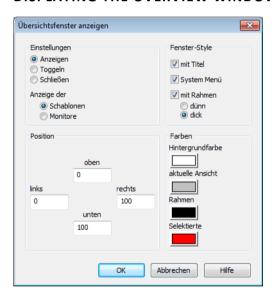

The Show overview window function displays the overview window in Runtime, which shows the real monitors or frames in a multi-monitor system. A monitor and/or a frame can be activated by means of a mouse click.

To configure the function:

- 1. Create a new function
- 2. Navigate to the node
- 3. Select the Show overview window function
- 4. the dialog for configuring the overview window is opened
- 5. Select your configuration
- 6. Close the dialog by clicking on OK
- 7. Allocate a button to the function

#### **DISPLAYING THE OVERVIEW WINDOW**

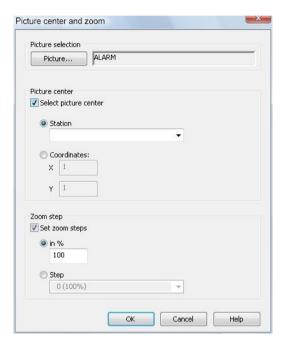

Parameters	Description
Settings	The function can either open, close or toggle the overview window. Selection is carried out by means of radio buttons:
Display	The overview window is opened.
Toggle	The display is switched between open and closed.
Close	The overview window is closed.
Display of	Selection of display in the overview window. Either frames or monitors are displayed.
Frames	The overview window divides the screen into frames.
Monitors	The overview window divides the screen into monitors.
Position	Position of the overview window on the screen, calculated in pixels from the upper left edge.
Window style	
With title	Active: The overview window has a Windows title bar.
System menu	Active: A system menu is displayed if the title bar is activated.
With frame	Active: Overview window is displayed with a border. The window size can be adjusted in Runtime by dragging the border. Selection of the border width by means of radio buttons:
Fine	Bold border.
Bold	Fine border.
Colors	Definition of the colors in the overview screen. Clicking on Color opens the palette.
Background color	Color of window background
Current view	Currently displayed frames/monitors.
Frame	Color of border.
Selected	Selected frames/monitors.
ок	Accepts settings, closes dialog and creates functions with assignment.
Cancel	Discards settings, closes dialog and creates functions with standard settings.
Help	Opens online help.

## 18.14 Screen: Move center

With this function, the screen center can be moved or the zoom factor can be changed in worldview function. As a requirement a screen has to be created, which is larger than the screen resolution. In the screen settings the option size From frame (on page 242) has to be deactivated and the size has to be defined directly.

Possible settings that can be configured are:

Screen	Selection of the screen for the new center
Select center of screen	Settings for the center
Object name	Set desired center via an object from the object list
Coordinates	Set desired center via coordinates (x,y)
Set zoom steps	Settings for the zoom factor
in %	Set desired zoom factor in percent
Level	Set desired zoom factor via the defined zoom steps
