1. Bienvenue dans l'aide de COPA-DATA

AIDE GÉNÉRALE

Si vous ne trouvez pas certaines informations dans ce chapitre de l'aide, ou si vous souhaitez nous suggérer d'intégrer un complément d'information, veuillez nous contacter par e-mail : [\(mailto:documentation@copadata.com\)](mailto:documentation@copadata.com).

ASSISTANCE PROJET

Si vous vous rendez compte que vous avez besoin de licences ou de modules supplémentaires, veuillez contacter l'équipe commerciale par e-mail : [\(mailto:support@copadata.com\)](mailto:support@copadata.com)

LICENCES ET MODULES

Si vous vous rendez compte que vous avez besoin de licences ou de modules supplémentaires, veuillez contacter l'équipe commerciale par e-mail : E-mail [\(mailto:sales@copadata.com\)](mailto:sales@copadata.com).

2. Contrôles

Dans zenon, vous pouvez intégrer vos propres contrôles. Pour cela, les possibilités suivantes sont disponibles :

- ▶ Contrôles utilisateur .NET (à la page 46) (pour la mise en œuvre dans zenon, voir également la section Contrôles .NET dans le manuel Synoptiques.)
- ▶ ActiveX (à la page 12) (pour la mise en œuvre dans zenon, voir également la section ActiveX dans le manuel Synoptiques.)
- ▶ WPF (à la page 79)

Informations

Des informations concernant l'utilisation des interfaces de programmation (PCE, VBA, VSTA) de zenon sont disponibles dans le manuel Interfaces de programmation.

Informations concernant la licence

Composante de la licence standard d'Editor et du Runtime.

Attention

Notez que les erreurs dans les applications telles que ActiveX, PCE, VBA, VSTA, WPF et les applications externes accédant à zenon via l'API peuvent également influencer la stabilité du Runtime.

3. Général

Les contrôles de zenon peuvent être mis en œuvre via ActiveX, .NET et WPF. Via VBA/VSTA, vous pouvez accéder à l'API de zenon.

3.1 Access zenon API

Dans zenon, vous pouvez améliorer un contrôle ActiveX avec des fonctions spéciales, afin d'accéder à l'API zenon.

ACCÉDEZ À L'API ZENON.

- ▶ Dans **Références du projet**, sélectionnez **Ajouter des références.... Bibliothèque d'objets de Runtime de zenon**
- ▶ Ajoutez les fonctions améliorées au code de classe du contrôle.

FONCTIONS ACTIVEX AMÉLIORÉES DE ZENON

```
// Appelé durant l'initialisation du contrôle dans le Runtime zenon.
```

```

public bool zenon>Init(zenon.Element dispElement)...
// Appelé durant la destruction du contrôle dans le Runtime zenon.
public bool zenonExit()
// Prend en charge la liaison de variable du contrôle
public short CanUseVariables()...
// Le contrôle COM prend en charge différents types de données.
public short VariableTypes()...
// Nombre maximal de variables pouvant être liées au contrôle.
public short MaxVariables()...

```

EXAMPLE

L'objet COM d'une variable de zenon est temporairement enregistré dans un membre, afin qu'il soit accessible ultérieurement via l'événement Paint du contrôle.

```

zenon.Variable m_cVal = null;
public bool zenon>Init(zenon.Element dispElement)
{
    if (dispElement.CountVariable > 0) {
        try {
            m_cVal = dispElement.ItemVariable(0);
            if (m_cVal != null) {
                object obRead = m_cVal.get_Value((object)-1);
                UserText = obRead.ToString();
            }
        }catch { }
    }
    return true;
}
public bool zenonExit()
{
    try {
        if (m_cVal != null) {
            System.Runtime.InteropServices.Marshal.FinalReleaseComObject(m_cVal);
            m_cVal = null;
        }
    }
    catch { }
    return true;
}

```

```

public short CanUseVariables()
{
    return 1; // les variables sont prises en charge
}

public short VariableTypes()
{
    return short.MaxValue; // Tous les types de données sont pris en charge
}

public short MaxVariables()
{
    return 1; // Au maximum, une variable sera liée au contrôle
}

private void SamplesControl_Paint(object sender, PaintEventArgs e)
{
    // Les variables de zenon ont été modifiées
    try {
        if (m_cVal != null) {
            object obRead = m_cVal.get_Value((object)-1);
            UserText = obRead.ToString();
        }
    } catch { }
}

```

3.2 Méthodes

Les contrôles ActiveX et .NET utilisant des variables de zenon nécessitent certaines méthodes spécifiques.

3.2.1 CanUseVariables

Prototype : **short CanUseVariables();**

Cette méthode renvoie 1 ou 0

Vale ur	Description
1 :	<p>Le contrôle peut utiliser des variables de zenon.</p> <p>Pour l'élément dynamique (via le bouton Variable), vous pouvez uniquement déclarer des variables de zenon avec le type déclaré par le biais de la méthode VariableTypes (à la page 10), conformément au nombre défini par la méthode MaxVariables (à la page 10).</p>
0 :	<p>Le contrôle ne peut pas utiliser de variables de zenon, ou ne dispose pas de la méthode adéquate.</p> <p>Vous pouvez déclarer des variables de tout type, sans limitation de nombre. Dans le Runtime, toutefois, ces variables sont uniquement utilisables avec du code VBA.</p>

3.2.2 MaxVariables

Prototype : `short MaxVariables();`

Dans cette section est défini le nombre de variables pouvant être sélectionnées dans la liste de variables.

Si la valeur 1 est renvoyée, la sélection multiple est désactivée dans la liste de variables. Un avertissement est alors affiché si plusieurs variables sont sélectionnées.

3.2.3 Types de variables

Prototype : `short VariableTypes();`

La valeur renvoyée par cette méthode est utilisée comme masque pour les types de variable utilisables dans la liste de variables. La valeur est une relation **AND** (et) parmi les valeurs suivantes (définies dans zenon32/dy_type.h) :

Valeur 1	Valeur 2	Équivalent
WORD	0x0001	Position 0
BYTE	0x0002	Position 1
BIT	0x0004	Position 2
DWORD	0x0008	Position 3
FLOAT	0x0010	Position 4
DFLOAT	0x0020	Position 5
STRING	0x0040	Position 6
IN_OUTPUT	0x8000	Position 15

3.2.4 zenonExit

Prototype : `boolean zenonExit();`

Cette méthode est appelée par le Runtime de zenon lorsque le contrôle ActiveX est fermé.

Ici, tous les pointeurs de répartition renvoyant à des variables doivent être libérés.

3.2.5 zenonExitEd

Équivalent à zenonExit (à la page 11) ; exécuté lors de la fermeture d'ActiveX dans Editor.

Cette méthode permet de réagir aux changements dans ActiveX, par exemple aux modifications de valeurs dans Editor.

Information : actuellement uniquement disponible pour ActiveX.

3.2.6 zenonInit

Prototype : `boolean zenonInit(IDispatch*dispElement);`

Cette méthode (dans le Runtime) permet au contrôle ActiveX d'obtenir un pointeur vers l'interface de répartition de l'élément dynamique. Ce pointeur permet également d'accéder aux variables de zenon liées à l'élément dynamique.

Vous définissez l'ordre de tri des variables transférées dans la configuration de l'élément ActiveX à l'aide des boutons **Bas** ou **Haut**.

La boîte de dialogue **Entrer les propriétés** apparaît lorsque vous double-cliquez sur l'élément ActiveX ou que vous sélectionnez la propriété **Paramètres ActiveX** dans les propriétés de l'élément, dans le nœud **Affichage**.

3.2.7 zenonInitEd

Équivalent à zenonInit (à la page 11) ; exécuté lors de l'ouverture d'ActiveX dans Editor (double-cliquez sur le contrôle ActiveX).

Information : actuellement uniquement disponible pour ActiveX.

4. ActiveX

ActiveX permet d'améliorer de manière autonome les fonctionnalités du Runtime et d'Editor de zenon.

Dans ce manuel, vous trouverez des informations concernant :

- ▶ Développement d'éléments ActiveX (à la page 12)
- ▶ Exemple : LatchedSwitch (C++) (à la page 15)
- ▶ Exemple : CD SliderCtrl (C++) (à la page 25)
- ▶ Exemple : contrôle. NET exécuté en tant que contrôle ActiveX (C#) (à la page 32)

Vous trouverez d'autres informations concernant les éléments dynamiques ActiveX dans le manuel Synoptiques, au chapitre ActiveX.

ACTIVEX POUR WINDOWS CE

Si un contrôle ActiveX Control doit être exécuté sous Windows CE, le modèle de cloisonnement (**apartment**) doit être défini sur **Threading (Thread)** cloisonné. S'il est défini sur **Free (Libre)**, le contrôle ne s'exécutera pas dans le Runtime de zenon.

4.1 Développement d'éléments ActiveX

L'élément dynamique ActiveX dans zenon peut transmettre des variables au contrôle ActiveX sans utiliser VBA pour actionner le contrôle.

Le contrôle définit maintenant automatiquement combien de variables zenon il peut utiliser et de quel type ces variables peuvent être. The properties of the control can be established by means of dynamic elements.

Pour cela, l'interface (interface de transmission) du contrôle doit être compatible avec un certain nombre de méthodes (à la page 13) .

4.1.1 Méthodes

Chaque contrôle ActiveX pouvant utiliser des variables de zenon doit contenir les méthodes suivantes :

- ▶ [CanUseVariables](#) (à la page 9)
- ▶ [MaxVariables](#) (à la page 10)
- ▶ [Types de variables](#) (à la page 10)
- ▶ [zenonExit](#) (à la page 11)
- ▶ [zenonExitEd](#) (à la page 11)
- ▶ [zenonInit](#) (à la page 11)
- ▶ [zenonInitEd](#) (à la page 12)

L'ID de répartition des méthodes dans l'interface est sans importance. Lors de l'appel des méthodes, zenon reçoit l'ID de l'interface.

CanUseVariables

Prototype : `short CanUseVariables();`

Cette méthode renvoie 1 ou 0

Vale ur	Description
1 :	<p>Le contrôle peut utiliser des variables de zenon.</p> <p>Pour l'élément dynamique (via le bouton Variable), vous pouvez uniquement déclarer des variables de zenon avec le type déclaré par le biais de la méthode VariableTypes (à la page 10), conformément au nombre défini par la méthode MaxVariables (à la page 10).</p>
0 :	<p>Le contrôle ne peut pas utiliser de variables de zenon, ou ne dispose pas de la méthode adéquate.</p> <p>Vous pouvez déclarer des variables de tout type, sans limitation de nombre. Dans le Runtime, toutefois, ces variables sont uniquement utilisables avec du code VBA.</p>

MaxVariables

Prototype : `short MaxVariables();`

Dans cette section est défini le nombre de variables pouvant être sélectionnées dans la liste de variables.

Si la valeur 1 est renvoyée, la sélection multiple est désactivée dans la liste de variables. Un avertissement est alors affiché si plusieurs variables sont sélectionnées.

Types de variables

Prototype : `short VariableTypes();`

La valeur renvoyée par cette méthode est utilisée comme masque pour les types de variable utilisables dans la liste de variables. La valeur est une relation **AND** (et) parmi les valeurs suivantes (définies dans zenon32/dy_type.h) :

Valeur 1	Valeur 2	Équivalent
WORD	0x0001	Position 0
BYTE	0x0002	Position 1
BIT	0x0004	Position 2
DWORD	0x0008	Position 3
FLOAT	0x0010	Position 4
DFLOAT	0x0020	Position 5
STRING	0x0040	Position 6
IN_OUTPUT	0x8000	Position 15

zenonExit

Prototype : `boolean zenonExit();`

Cette méthode est appelée par le Runtime de zenon lorsque le contrôle ActiveX est fermé.

Ici, tous les pointeurs de répartition renvoyant à des variables doivent être libérés.

zenonExitEd

Équivalent à zenonExit (à la page 11) ; exécuté lors de la fermeture d'ActiveX dans Editor.

Cette méthode permet de réagir aux changements dans ActiveX, par exemple aux modifications de valeurs dans Editor.

Information : actuellement uniquement disponible pour ActiveX.

zenonInit

Prototype : `boolean zenonInit(IDispatch*dispElement);`

Cette méthode (dans le Runtime) permet au contrôle ActiveX d'obtenir un pointeur vers l'interface de répartition de l'élément dynamique. Ce pointeur permet également d'accéder aux variables de zenon liées à l'élément dynamique.

Vous définissez l'ordre de tri des variables transférées dans la configuration de l'élément ActiveX à l'aide des boutons **Bas** ou **Haut**.

La boîte de dialogue **Entrer les propriétés** apparaît lorsque vous double-cliquez sur l'élément ActiveX ou que vous sélectionnez la propriété **Paramètres ActiveX** dans les propriétés de l'élément, dans le nœud **Affichage**.

zenonInitEd

Équivalent à zenonInit (à la page 11) ; exécuté lors de l'ouverture d'ActiveX dans Editor (double-cliquez sur le contrôle ActiveX).

Information : actuellement uniquement disponible pour ActiveX.

4.2 Exemple : LatchedSwitch (C++)

L'exemple suivant décrit un contrôle ActiveX exécutant un verrouillage d'interrupteur avec deux variables de bit. La première variable représente l'interrupteur et la deuxième, le verrou. La valeur de la variable de commutation du contrôle ActiveX peut uniquement être modifiée si la variable de verrouillage possède la valeur 0.

L'état de l'élément est représenté par quatre fichiers bitmap pouvant être sélectionnés dans la boîte de dialogue de propriétés du contrôle, dans zenon Editor.

4.2.1 Interface

Le contrôle LatchedSwitch comporte l'interface de répartition suivante :

```
[ uuid(EB207159-D7C9-11D3-B019-080009FBEAA2),
helpstring(Dispatch interface for LatchedSwitch Control), hidden ]
dispproxy _DLatchedSwitch
{
    properties:
        // NOTE - ClassWizard conserve les informations de méthodes ici.
        // Soyez très prudent si vous modifiez cette section !
        //{{AFX_ODL_PROP(CLatchedSwitchCtrl)}
```

```

[id(1)] boolean SollwertDirekt;
[id(2)] IPictureDisp* SwitchOn; // conteneur pour bitmaps
[id(3)] IPictureDisp* SwitchOff;
[id(4)] IPictureDisp* LatchedOn;
[id(5)] IPictureDisp* LatchedOff;
//}}AFX_ODL_PROP

methods:
// NOTE - ClassWizard conserve les informations de méthodes ici.
// Soyez très prudent si vous modifiez cette section !
//{{AFX_ODL_METHOD(CLatchedSwitchCtrl)
//}}AFX_ODL_METHOD
[id(6)] short CanUseVariables();
[id(7)] short VariableTypes();
[id(8)] short MaxVariables();
[id(9)] boolean zenonInit(IDispatch* dispElement);
[id(10)] boolean zenonExit();
[id(DISPID_ABOUTBOX)] void AboutBox();
};

```

Les propriétés **SwitchOn** à **LatchedOff** contiennent les fichiers bitmap correspondant aux quatre différents états du contrôle. Les fichiers bitmap sont conservés dans des objets de la classe **CScreenHolder**. La propriété **SollwertDirekt** définit si la saisie de valeurs prescrites doit être effectuée dans une boîte de dialogue, ou directement en cliquant sur le contrôle.

4.2.2 Contrôle

La mise en œuvre du contrôle s'effectue par le biais de la classe **CLatchedSwitchCtrl**. Les membres de cette classe sont les objets **CScreenHolder** destinés au stockage de bitmaps. En outre, trois drivers de répartition sont générés pour l'élément dynamique et les variables :

```

class CLatchedSwitchCtrl : public COleControl
{
    DECLARE_DYNCREATE(CLatchedSwitchCtrl)

    // Constructeur
public:
    CLatchedSwitchCtrl();

    // Substitutions

```

```
// Substitutions de fonctions virtuelles générées par ClassWizard
//{{AFX_VIRTUAL(CLatchedSwitchCtrl)
public:
virtual void OnDraw (CDC* pdc, const CRect& rcBounds, const CRect& rcInvalid);
virtual void DoPropExchange (CPropExchange* pPX);
virtual void OnResetState ();
virtual DWORD GetControlFlags();
//}}AFX_VIRTUAL

// Mise en œuvre
protected:

~CLatchedSwitchCtrl();

DECLARE_OLECREATE_EX(CLatchedSwitchCtrl)      // Fabrique de classe et guid
DECLARE_OLETYPelib(CLatchedSwitchCtrl)         // GetTypeInfo
DECLARE_PROPPAGEIDS (CLatchedSwitchCtrl)       // ID de page de propriété
DECLARE_OLECLTYPE (CLatchedSwitchCtrl) // Nom de type et informations d'état diverses

// Tables de messages

//{{AFX_MSG(CLatchedSwitchCtrl)
afx_msg void OnLButtonDown(UINT nFlags, CPoint point);
//}}AFX_MSG
DECLARE_MESSAGE_MAP()

// Tables de répartition

    dispidZenOnInit = 9L,
    dispidZenOnExit = 10L,
// } }AFX_DISP_ID
};

};

}
;

```

4.2.3 Méthodes

Les méthodes suivantes sont utilisées :

- ▶ [CanUseVariables](#) (à la page 19)
- ▶ [Types de variables](#) (à la page 19)
- ▶ [MaxVariables](#) (à la page 20)
- ▶ [zenonInit](#) (à la page 20)
- ▶ [zenonExit](#) (à la page 21)

CanUseVariables

Cette méthode renvoie 1, ce qui permet d'utiliser des variables de zenon.

```

short CLatchedSwitchCtrl::CanUseVariables()
{
    return 1;
}

```

Types de variables

Le contrôle est uniquement utilisable avec les variables de bit, donc le résultat 0x0004 est renvoyé.

```

short CLatchedSwitchCtrl::VariableTypes()
{
}

```

```
return 0x0004; // Variables de bit uniquement
}
```

MaxVariables

Deux variables peuvent être utilisées. La valeur 2 est donc renvoyée.

```
short CLatchedSwitchCtrl::MaxVariables()
{
    return 2; // 2 variables
}
```

zenonInit

Cette méthode obtient les drivers de répartition (Dispatchdriver) des variables via le pointeur de répartition (Dispatchpointer) de l'élément dynamique. Avec ce pointeur (Pointer), les valeurs des variables sont lues et écrites lorsque l'utilisateur clique et lors du traçage du contrôle.

```
BOOL CLatchedSwitchCtrl::zenonInit(LPDISPATCH dispElement)
{
    m_dElement = IEElement(dispElement);
    Element.m_lpDispatch->AddRef();
    if (m_dElement.GetCountVariable() >= 2)
    {
        short iIndex = 0;
        m_dSwitchVar = IVariable(m_dElement.ItemVariable(COleVariant(iIndex)));
        m_dLatchVar = IVariable(m_dElement.ItemVariable(COleVariant(++iIndex)));
    }
    return TRUE;
}
```

Informations

Element.m_lpDispatch->AddRef();

Objects that are not used are automatically deleted from the memory. This must be carried out by the programming. The programmer determines whether an object - based on a reference counter - can be removed.

COM uses the `IUnkown` methods `AddRef` and `Release` to administer the number of references of interfaces to an object.

The general rule for calling up these methods are:

- ▶ `AddRef` must always be called up on the interface if the client receives an interface pointer.
- ▶ A `Release` must always be called up if the client ends the use of the interface pointer.

With a simple implementation, a counter variable in the object is increased with an `AddRef` call. Each call of a `Release` reduces this counter in the object. If this counter is at ZERO again, the interface can be removed from the memory.

A reference counter can also be implemented so that each reference to the object (and not to an individual interface) is counted.

In this case, each `AddRef` and each `Release` substitute call up a central implementation to the object. A `Release` then unlocks the complete object if the reference counter has reached zero.

zenonExit

Cette méthode libère le driver de répartition.

```
BOOL CLatchedSwitchCtrl::zenonExit()  
{  
  
    m_dElement.ReleaseDispatch();  
    m_dSwitchVar.ReleaseDispatch();  
    m_dLatchVar.ReleaseDispatch();  
  
    return TRUE;  
}
```

4.2.4 Utilisation et affichage

Écrire valeur prescrite :

Une valeur peut être définie en cliquant sur le contrôle avec le bouton gauche de la souris.

Si **m_iSollwertDirekt** est égal à 0, une boîte de dialogue de sélection de la valeur prescrite s'affiche ; dans le cas contraire, la valeur actuelle de la variable de commutation est inversée.

Si la variable de verrouillage possède la valeur 1, seule la fonction `MessageBeep` est exécutée. Aucune valeur ne peut être définie par le biais du contrôle.

```
void CLatchedSwitchCtrl::OnLButtonDown(UINT nFlags, CPoint point)
{
    CRect rcBounds;
    GetWindowRect(&rcBounds);

    ColeVariant coleValue((BYTE)TRUE);
    BOOL bLatch = (BOOL)VariantToDouble((LPVARIANT)&m_dLatchVar.GetValue());
    BOOL bSwitch = (BOOL)VariantToDouble((LPVARIANT)&m_dSwitchVar.GetValue());

    if (bLatch) // Verrouillée !!!
        MessageBeep(MB_ICONEXCLAMATION);
    else
    {

        if (m_sollwertDirekt)
        {

            bSwitch = !bSwitch;
        }
        else
        {

            CSollwertDlg dlg;
            dlg.m_iSollwert = bSwitch ? 1 : 0;
            if (dlg.DoModal() == IDOK)
            {

```

```

if (dlg.m_iSollwert == 2)      // Changement

bSwitch = !bSwitch;
else

bSwitch = (BOOL)dlg.m_iSollwert;
}

}

coleValue = (double)bSwitch;
m_dSwitchVar.SetValue(coleValue);
}

ColeControl::OnLButtonDown(nFlags, point);
}

```

Dessin

Lors du tracé du contrôle, les valeurs des variables sont lues depuis les drivers de répartition et l'un des quatre éléments graphiques définis est affiché. Lorsque la valeur d'une variable est modifiée, le contrôle est actualisé par le processus **OnDraw**.

```

void CLatchedSwitchCtrl::OnDraw(CDC* pdc, const CRect& rcBounds, const CRect& rcInvalid)
{

CRect rcBitmap = rcBounds;
rcBitmap.NormalizeRect();

if (!m_dElement)
{

m_SwitchOn.Render(pdc, &rcBounds, &rcBounds);
return;
}

BOOL bVal1 = 0, bVal2 = 0;
VARIANT vRes;
if (m_dSwitchVar)      // La variable existe-t-elle ?
{

vRes = m_dSwitchVar.GetValue();

```

```
bVal1 = (BOOL)VariantToDouble(&vRes);  
}  
if (m_dLatchVar)      // La variable existe-t-elle ?  
{  
  
    vRes = m_dLatchVar.GetValue();  
    bVal1 = (BOOL)VariantToDouble(&vRes);  
}  
  
if (bVal1 && bVal2)  
  
    m_SwitchOn.Render(pdc, rcBitmap, rcBitmap);  
else if (!bVal1 && bVal2)  
  
    m_SwitchOff.Render(pdc, rcBitmap, rcBitmap);  
else if (bVal1 && !bVal2)  
  
    m_LatchedOn.Render(pdc, rcBitmap, rcBitmap);  
else  
  
    m_LatchedOff.Render(pdc, rcBitmap, rcBitmap);  
}
```

4.2.5 Interface de zenon

Les classes résultant de COleDispatchDriver doivent être créées pour l'élément et les variables, afin que l'interface de répartition de zenon puisse être utilisée pour définir les valeurs. La manière la plus simple de créer ces dernières consiste à utiliser l'Assistant Classes de l'environnement de développement (cliquez sur le bouton **Ajouter une classe**, puis sélectionnez **Depuis une bibliothèque de types** et zenrt32.tlb).

Pour notre contrôle, ces classes sont **IElement** et **IVariable**. Elles sont définies dans zenrt32.h et zenrt32.cpp.

4.3 Exemple : CD SliderCtrl (C++)

L'exemple suivant décrit un contrôle ActiveX équivalent au contrôle Windows **SliderCtrl**. Ce composant peut être lié à une variable de zenon. L'utilisateur peut modifier la valeur d'une variable à l'aide de ce curseur. Si la valeur de la variable est modifiée avec un autre élément dynamique, le curseur est mis à jour.

4.3.1 Interface

Le contrôle **CD_SliderCtrl** comporte l'interface de répartition suivante :

```
[ uuid(5CD1B01D-015E-11D4-A1DF-080009FD837F),
  helpstring(Dispatch interface for CD_SliderCtrl Control), hidden
]
dispinterface _DCD_SliderCtrl
{
  properties: //*** Propriétés des contrôles

  [id(1)] short TickRaster;
  [id(2)] boolean ShowVertical;
  [id(3)] short LineSize;

  methods: //*** Méthode du contrôle (pour ActiveX dans zenon)

  [id(4)] boolean zenonInit(IDispatch* pElementInterface);
  [id(5)] boolean zenonExit();
  [id(6)] short VariableTypes();
  [id(7)] short CanUseVariables();
  [id(8)] short MaxVariables();

  [id(DISPID_ABOUTBOX)] void AboutBox();
};

```

4.3.2 Contrôle

La mise en œuvre du contrôle s'effectue par le biais de la classe **CD_SliderCtrlCtrl**. Cette classe comporte un membre **CSliderCtrl** standard de Windows, le contrôle étant sous-classé à cet élément. Les

interfaces **IVariable** et **IElement** contiennent des interfaces de zenon devant être intégrées. Celles-ci découlent de **COleDispatchDriver**.

```

class CCD_SliderCtrlCtrl : public COleControl
{
    DECLARE_DYNCREATE(CCD_SliderCtrlCtrl)
private: //*** Variables membres

    BOOL m_bInitialized;
    BOOL         m_bShowVertical;
    BOOL m_bTicksBoth;
    long          m_nRangeStart;
    long          m_nRangeEnd;
    long m_nTickOrientation;
    IVariable     m_interfaceVariable;
    IELEMENT     m_interfaceElement;
    CSliderCtrl   m_wndSliderCtrl;

public:
    CCD_SliderCtrlCtrl();

    //{{AFX_VIRTUAL(CCD_SliderCtrlCtrl)
public:
    virtual void OnDraw (CDC* pdc, const CRect& rcBounds, const CRect& rcInvalid);
    virtual BOOL PreCreateWindow(CREATESTRUCT& cs);
    virtual void DoPropExchange (CPropExchange* pPX);
    virtual void OnResetState () ;
    //}}AFX_VIRTUAL

protected:

    ~CCD_SliderCtrlCtrl();
    //*** méthodes de conversion de la variante
    double VariantToDouble(const VARIANT FAR *vValue);

    DECLARE_OLECREATE_EX(CCD_SliderCtrlCtrl)      // Fabrique de classe et guid

    DECLARE_OLETYPelib (CCD_SliderCtrlCtrl)        // GetTypeInfo

```

```
DECLARE_PROPAGEIDS (CCD_SliderCtrlCtrl)      // ID de page de propriété
DECLARE_OLECLTYPE (CCD_SliderCtrlCtrl) // Nom de type et informations d'état diverses

//*** méthodes de fonctionnement de l'élément SliderCtrl
BOOL    IsSubclassedControl ();
LRESULT OnOcmCommand      (WPARAM wParam, LPARAM lParam);

//{{AFX_MSG(CCD_SliderCtrlCtrl)
afx_msg int  OnCreate(LPCREATESTRUCT lpCreateStruct);
afx_msg void HScroll(UINT nSBCode, UINT nPos);
afx_msg void HScroll(UINT nSBCode, UINT nPos);
afx_msg void OnLButtonDown(UINT nFlags, CPoint point);
afx_msg void OnLButtonUp(UINT nFlags, CPoint point);
//}}AFX_MSG

afx_msg void SetTickOnBothSides (short nnewValue);
afx_msg BOOL GetShowVertical();
afx_msg void SetShowVertical(BOOL bnewValue);
afx_msg short GetTickOrientation();
afx_msg void SetTickOrientation (short nnewValue);
afx_msg BOOL zenonInit(LPDISPATCH pElementInterface);
afx_msg BOOL zenonExit();
afx_msg short VariableTypes();
afx_msg short CanUseVariables();
afx_msg short MaxVariables();
//}}AFX_DISPATCH
DECLARE_DISPATCH_MAP()

afx_msg void AboutBox();

//{{AFX_EVENT(CCD_SliderCtrlCtrl)
//}}AFX_EVENT
DECLARE_EVENT_MAP()
```

```
public:

enum {
//{{AFX_DISP_ID( CCD_SliderCtrlCtrl)
dispidShowVertical = 1L,
dispidTicksOnBothSides = 2L,
dispidTickOrientation = 3L,
dispidZenOnInit = 4L,
dispidZenOnExit = 5L,
dispidVariableTypes = 6L,
dispidCanUseVariables = 7L,
dispidMaxVariables = 8L,
//}}AFX_DISP_ID
};

};
```

4.3.3 Méthodes

Les méthodes suivantes sont utilisées :

- ▶ CanUseVariables (à la page 28)
 - ▶ Types de variables (à la page 29)
 - ▶ MaxVariables (à la page 29)
 - ▶ zenonInit (à la page 29)
 - ▶ zenonExit (à la page 30)

CanUseVariables

Cette méthode renvoie 1, ce qui permet d'utiliser des variables de zenon.

```
short CCD_SliderCtrlCtrl::CanUseVariables()
{
    return 1;
}
```

Types de variables

Le contrôle peut utiliser les variables de type mot, octet, double mot et flottante. Vous trouverez une liste des types de données utilisables dans la description (à la page 10) générale de cette méthode.

```
short CCD_SliderCtrlCtrl::VariableTypes()
{
    return 0x0001 | // Mot
           0x0002 | // Octet
           0x0008 | // DWord
           0x0010 | // Flottante
           0x0020 | // D flottante
}
```

MaxVariables

Une seule variable peut être liée à ce contrôle.

```
short CCD_SliderCtrlCtrl::MaxVariables()
{
    return 1; // 1 variables
}
```

zenonInit

Le paramètre **dispElement** contient l'interface de l'élément dynamique. Cet élément permet de déterminer la variable zenon liée. Si elle est valide, la plage d'affichage du contrôle **SlideCtrl** est définie. En outre, les paramètres d'affichage (nombre de graduations, etc.) sont définis. Si aucune variable n'est liée, la plage d'affichage définie s'étend de 0 à 0. Le contrôle SliderCtrl ne peut donc pas être modifié. La variable **m_bInitialized** définit la capacité d'ajuster les valeurs.

```
BOOL CCD_SliderCtrlCtrl::zenonInit(LPDISPATCH dispElement)
{
    //*** Déterminer la variable à l'aide de l'élément de zenon

    m_interfaceElement =     IElement(pElementInterface);
    if (m_interfaceElement.GetCountVariable() > 0) {

        short nIndex = 0;
```

```
m_interfaceVariable = IVariable
(m_interfaceElement.ItemVariable(ColeVariant(nIndex)));
}

//*** Initialiser la taille du contrôle Slider-Ctrl
if (m_interfaceVariable) {

//*** Définir la plage
m_nRangeStart = (long) VariantToDouble(&m_interfaceVariable.GetRangeMin());
m_nRangeEnd = (long) VariantToDouble(&m_interfaceVariable.GetRangeMax());
m_wndSliderCtrl.SetRange(m_nRangeStart,m_nRangeEnd,TRUE);
//*** Définir les graduations intermédiaires
m_wndSliderCtrl.SetTicFreq(m_nTickCount);
m_wndSliderCtrl.SetPageSize(m_nTickCount);
m_wndSliderCtrl.SetLineSize(m_nLineSize);
} else {

m_wndSliderCtrl.SetRange(0,0,TRUE);
return FALSE;
}

m_bInitialized = TRUE;
return TRUE;
}
```

zenonExit

Dans cette méthode, les interfaces de zenon sont à nouveau libérées.

```
BOOL CCD_SliderCtrlCtrl::zenonExit()
{
    m_interfaceElement.ReleaseDispatch();
    m_interfaceVariable.ReleaseDispatch();
    return TRUE;
}
```

4.3.4 Utilisation et affichage

Dessin

DoSuperclassPaint dessine l'élément SliderCtrl (il s'agit d'un contrôle sous-classé). Si le curseur est déplacé lors de l'étape de dessin, la variable **m_bInitialized** reçoit la valeur FALSE. Ceci garantit que la valeur peut être modifiée. Normalement, la valeur de la variable est lue et affichée avec la méthode **SetPos** de l'élément SliderCtrl.

```
void CCD_SliderCtrlCtrl::OnDraw(CDC* pdc, const CRect& rcBounds, const CRect& rcInvalid)
{
    //*** actualiser l'affichage
    DoSuperclassPaint(pdc, rcBounds);
    if (m_interfaceVariable && m_bInitialized) {
        ColeVariant cValue(m_interfaceVariable.GetValue());
        int nValue = (int) VariantToDouble(&cValue.Detach());
        m_wndSliderCtrl.SetPos(nValue);
    }
}
```

Écrire valeur prescrite :

Dans la méthode **LButtonDown**, la variable **m_bInitialized** est définie sur FALSE et, dans l'événement **LbuttonUp**, elle est à nouveau définie sur TRUE. Ceci garantit que la valeur peut être modifiée. Dans le cas contraire, la procédure **OnDraw** serait exécutée et l'ancienne valeur serait affichée.

```
void CCD_SliderCtrlCtrl::OnLButtonDown(UINT nFlags, CPoint point)
{
    m_bInitialized = FALSE;
    ColeControl::OnLButtonDown(nFlags, point);
}

void CCD_SliderCtrlCtrl::OnLButtonUp(UINT nFlags, CPoint point)
{
    m_bInitialized = TRUE;
    ColeControl::OnLButtonUp(nFlags, point);
}
```

Une valeur est transmise au matériel lorsque le curseur est déplacé. Dans les méthodes **Hscroll** et **Vscroll**, la valeur est transmise au matériel (selon la configuration horizontale ou verticale du curseur).

```
void CCD_SliderCtrlCtrl::HScroll(UINT nSBCode, UINT nPos)
{
    switch (nSBCode) {

        case TB_LINEUP:
        case TB_PAGEUP:
        case TB_LINEDOWN:
        case TB_PAGEDOWN:
        case TB_THUMBTRACK:
        case TB_THUMBPOSITION:{

            //*** Définir la valeur sans boîte de dialogue ?
            int nValue =           m_wndSliderCtrl.GetPos();
            COleVariant cValue((short) nValue, VT_I2);
            m_interfaceVariable.SetValue(cValue);
        }
    }
}
```

4.3.5 Interface de zenon

Les classes résultant de COleDispatchDriver doivent être créées pour l'élément et les variables, afin que l'interface de répartition de zenon puisse être utilisée pour définir les valeurs. La manière la plus simple de créer ces dernières consiste à utiliser l'Assistant Classes de l'environnement de développement (cliquez sur le bouton **Ajouter une classe**, puis sélectionnez **Depuis une bibliothèque de types** et zenrt32.tlb).

Pour notre contrôle, ces classes sont **IElement** et **IVariable**. Elles sont définies dans zenrt32.h et zenrt32.cpp.

4.4 Exemple : contrôle .NET exécuté en tant que contrôle ActiveX (C#)

L'exemple suivant décrit un contrôle .NET exécuté comme un contrôle ActiveX dans zenon.

La création et l'intégration se déroulent en quatre étapes :

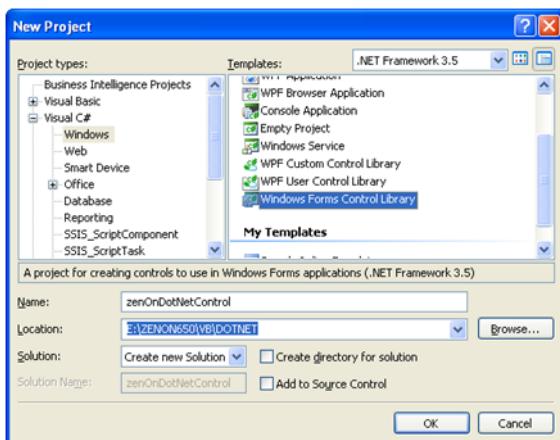

1. Création d'un contrôle de formulaire Windows (à la page 33)
2. Conversion d'un contrôle utilisateur .NET en double contrôle (à la page 36)
3. Utilisation avec ActiveX dans Editor via le code VBA (à la page 41)
4. Connexion de variables de zenon au contrôle utilisateur .NET (à la page 42)

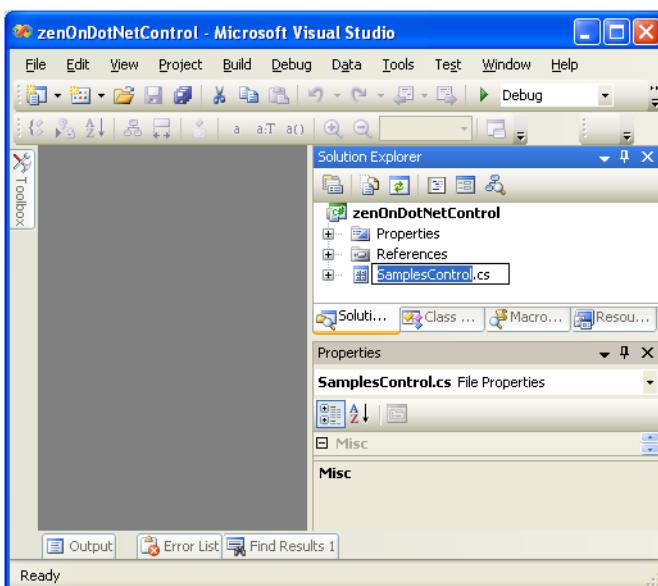

4.4.1 Crédit d'un contrôle de formulaire Windows

Pour créer un contrôle de formulaire Windows :

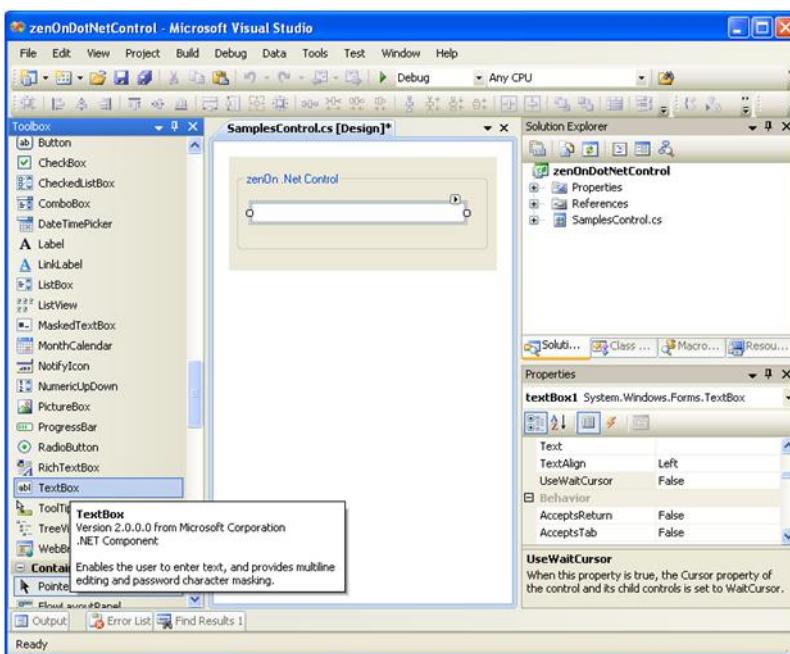

1. Démarrez Visual Studio 2008 et créez un nouveau projet **Windows Form Control Library** (Bibliothèque de contrôles de formulaire Windows) :

2. Renommez le contrôle par défaut avec le nom de contrôle souhaité.
Pour cet exemple : **SamplesControl.cs**.

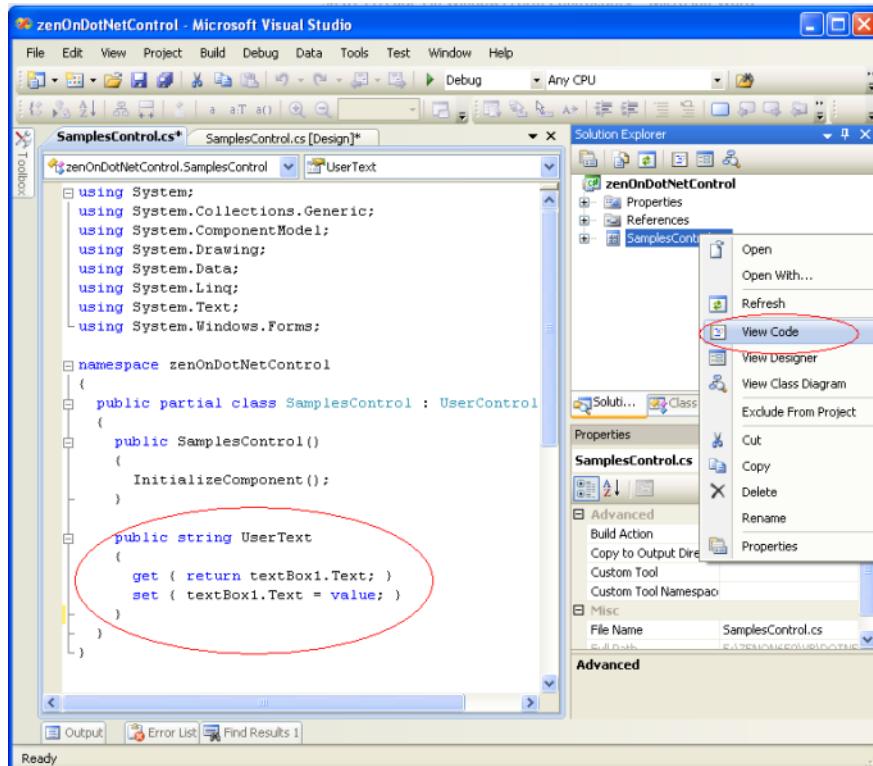

3. Ouvrez le concepteur de contrôles et ajoutez le contrôle souhaité (dans notre cas, un champ de texte) :

4. Les contrôles comportent normalement des propriétés. Ouvrez le concepteur de code en sélectionnant la fonction **Afficher le code**, puis ajoutez les propriétés devant que vous souhaitez rendre disponibles au niveau externe.

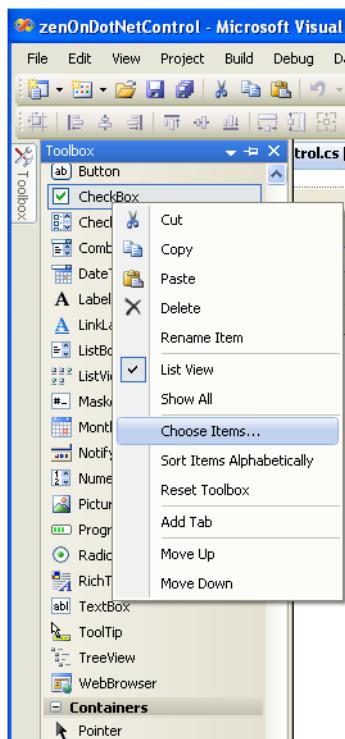

Pour cet exemple : la propriété visible au niveau externe "**UserText**", avec l'accès **get** et **set**, qui contient le texte du champ de texte :

5. Compilez le projet.

Le contrôle de formulaire Windows peut maintenant être utilisé dans d'autres projets de formulaires Windows.

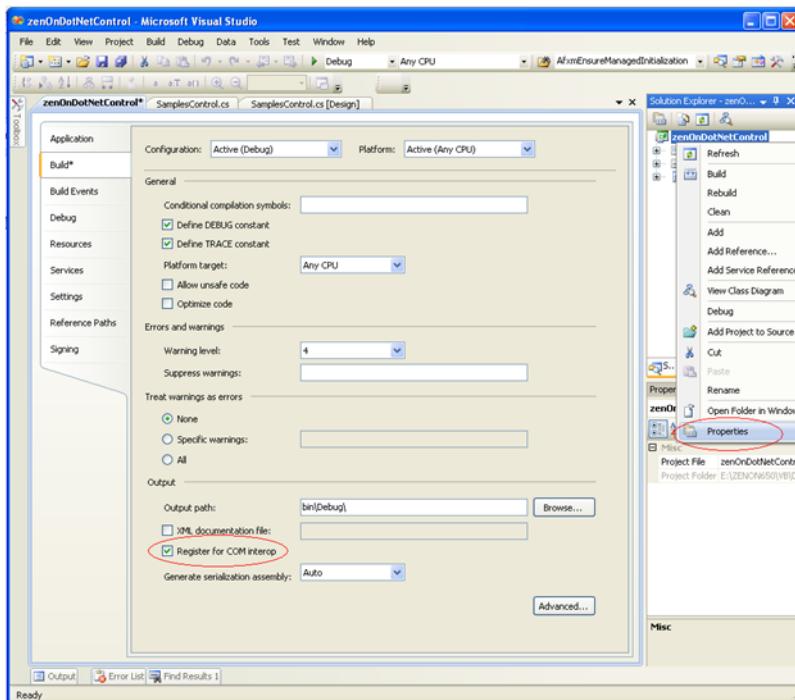

Important : le contrôle doit être inséré manuellement dans la boîte à outils de contrôle par le biais de la fonction **Choisir les éléments**.

4.4.2 Conversion d'un contrôle utilisateur .NET en double contrôle

Pour convertir un contrôle .NET en double contrôle, vous devez d'abord activer l'interface COM pour ActiveX.

- Ouvrez le projet et activez la propriété **Inscrire pour COM interop** dans les paramètres **Générer** :

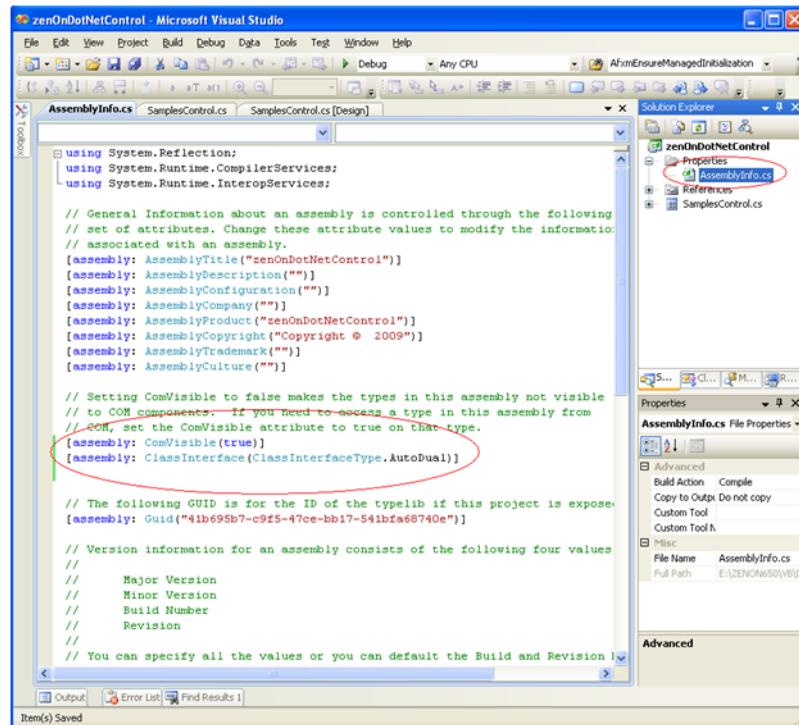

- Ouvrez le fichier **AssemblyInfo.cs** et

- définissez l'attribut **ComVisible** sur **true**
- ajoutez l'attribut **ClassInterface**

```
[assembly: ComVisible(true)]
```

[assembly: ClassInterface(ClassInterfaceType.AutoDual)]

```
using System.Reflection;
using System.Runtime.CompilerServices;
using System.Runtime.InteropServices;

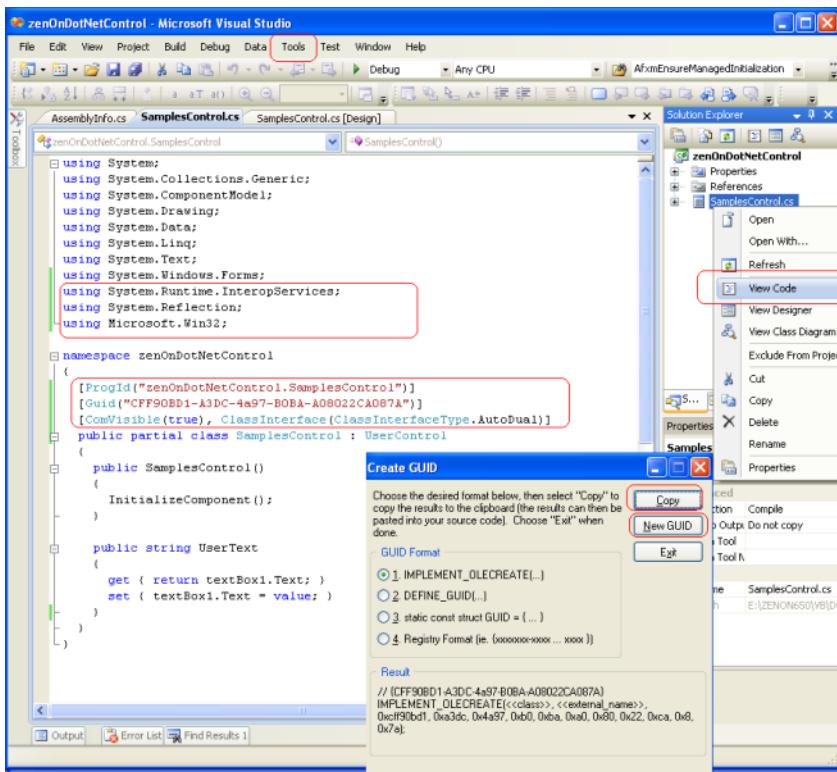

// General Information about an assembly is controlled through the following
// set of attributes. Change these attribute values to modify the information
// associated with an assembly.
[assembly: AssemblyTitle("zenOnDotNetControl")]
[assembly: AssemblyDescription("")]
[assembly: AssemblyConfiguration("")]
[assembly: AssemblyCompany("")]
[assembly: AssemblyProduct("zenOnDotNetControl")]
[assembly: AssemblyCopyright("Copyright © 2009")]
[assembly: AssemblyTrademark("")]
[assembly: AssemblyCulture("")]

// Setting ComVisible to false makes the types in this assembly not visible
// to COM components. If you need to access a type in this assembly from
// COM, set the ComVisible attribute to true on that type.
[assembly: ComVisible(true)]
[assembly: ClassInterface(ClassInterfaceType.AutoDual)]

// The following GUID is for the ID of the typelib if this project is exposed
[assembly: Guid("41b695b7-c9f5-47ce-bb17-541bfa68740e")]

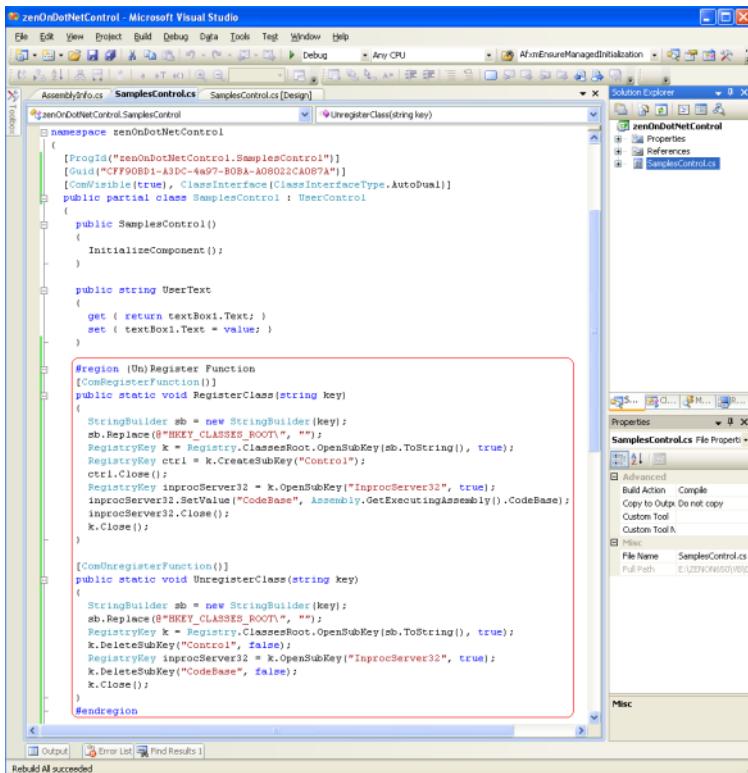

// Version information for an assembly consists of the following four values
//
// Major Version
// Minor Version
// Build Number
// Revision
//
// You can specify all the values or you can default the Build and Revision I
```

3. Ouvrez le concepteur de code en sélectionnant l'option **Afficher le code**, puis ajoutez les attributs ActiveX et les entrées **using** requis. Dans le menu **Outils/Create GUID**, créez un nouveau GUID pour l'attribut GUID :

4. Pour que le contrôle puisse être sélectionné comme un contrôle d'interface utilisateur Active X, vous devez ajouter des fonctions aux classes de contrôle suivantes :
- RegisterClass

- UnregisterClass

```

namespace zenOnDotNetControl
{
    [ProgId("zenOnDotNetControl.SamplesControl")]
    [Guid("CFF90B51-A3DC-4a97-B0BA-A08022CA087A")]
    [ComVisible(true), ClassInterface(ClassInterfaceType.AutoDual)]
    public partial class SamplesControl : UserControl
    {
        public SamplesControl()
        {
            InitializeComponent();
        }

        public string UserText
        {
            get { return textBox1.Text; }
            set { textBox1.Text = value; }
        }

        #region (Un)Register Function
        [ComRegisterFunction()]
        public static void RegisterClass(string key)
        {
            Stringbuilder sb = new Stringbuilder(key);
            sb.Replace(@"HKEY_CLASSES_ROOT\", "");
            RegistryKey k = Registry.ClassesRoot.OpenSubKey(sb.ToString(), true);
            RegistryKey ctrl = k.CreateSubKey("Control");
            ctrl.Close();
            RegistryKey inprocServer32 = k.OpenSubKey("InprocServer32", true);
            inprocServer32.SetValue("CodeBase", Assembly.GetExecutingAssembly().CodeBase);
            inprocServer32.Close();
            k.Close();
        }

        [ComUnregisterFunction()]
        public static void UnregisterClass(string key)
        {
            Stringbuilder sb = new Stringbuilder(key);
            sb.Replace(@"HKEY_CLASSES_ROOT\", "");
            RegistryKey k = Registry.ClassesRoot.OpenSubKey(sb.ToString(), true);
            k.DeleteSubKey("Control", false);
            RegistryKey inprocServer32 = k.OpenSubKey("InprocServer32", true);
            k.DeleteSubKey("CodeBase", false);
            k.Close();
        }
    #endregion
}

```

Vous pouvez ensuite inscrire le contrôle dans la base de registres.

5. Recompilez le projet.

Le contrôle de formulaire Windows est maintenant utilisable dans ActiveX, et a été inscrit automatiquement durant la création de la nouvelle version. Un fichier typelib supplémentaire, **zenonDotNetControl.tlb**, a été créé dans le répertoire de sortie.

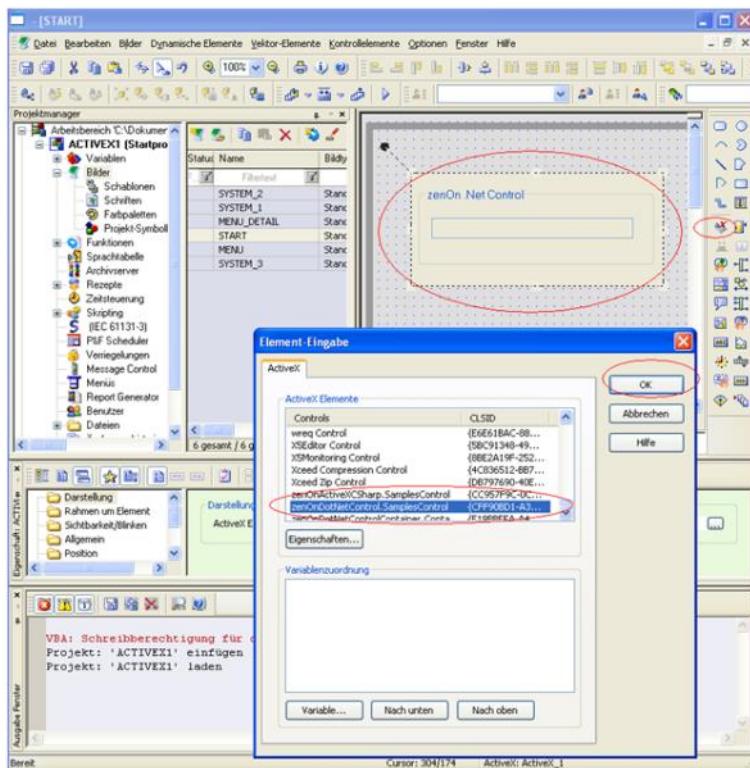

6. Pour utiliser le contrôle sur un autre ordinateur :

a) Copiez le fichier DLL et le fichier TLB sur l'ordinateur cible

b) Enregistrez les fichiers en saisissant la ligne de commande :

%windir%\Microsoft.NET\Framework\v2.0.50727\regasm.exe zenonDotNetControl.dll /tlb:zenonDotNetControl.tlb

7. Ajoutez le contrôle de formulaire étendu de Windows en tant que contrôle ActiveX dans zenon Editor :

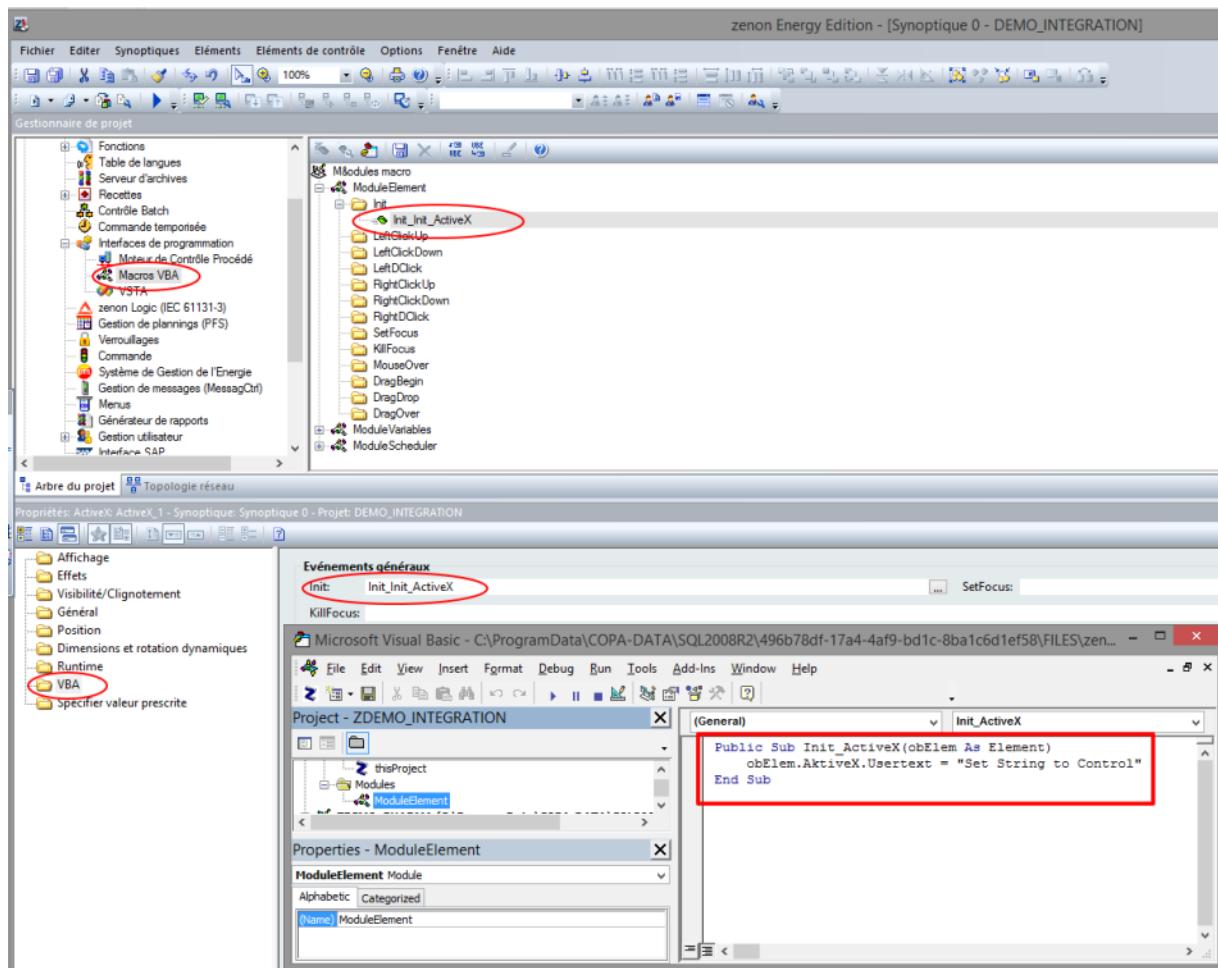

4.4.3 Utilisation avec ActiveX dans Editor via le code VBA

Pour accéder aux propriétés du contrôle dans zenon Editor :

1. Dans zenon Editor, dans le nœud **Interfaces de programmation/Macros VBA**, créez une nouvelle macro **Init** avec le nom **Init_ActiveX**.

Dans cette macro, vous pouvez accéder à toutes les propriétés externes via **obElem.ActiveX**.

2. Attribuez cette macro au contrôle ActiveX via les propriétés **macros VBA/Init** de l'élément ActiveX.

EXAMPLE DE MACRO INIT

```
Public Sub Init_ActiveX(obElem As Element)
    obElem.AktiveX.UserText = "Attribuez la chaîne au contrôle"
End Sub
```

4.4.4 Connexion de variables de zenon au contrôle utilisateur .NET

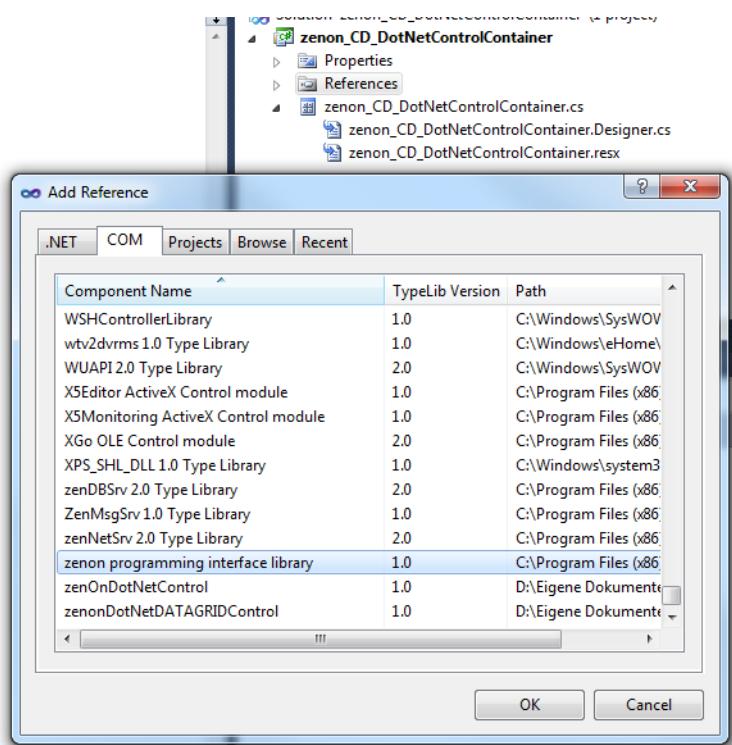

Dans zenon, vous avez la possibilité d'améliorer un contrôle ActiveX avec des fonctions spéciales pour accéder à l'API zenon.

MÉTHODES REQUISÉES

- ▶ public bool zenonInit (à la page 44) (appelé durant l'initialisation du contrôle dans le Runtime de zenon.)
- ▶ public bool zenonInitED (à la page 44) (utilisé dans Editor.)
- ▶ public bool zenonExit() (à la page 45) (appelé lors de la destruction du contrôle dans le Runtime de zenon.)
- ▶ public bool zenonExitED() (à la page 45) (utilisé dans Editor.)
- ▶ public short CanUseVariables() (à la page 45) (prend en charge la liaison de variables.)
- ▶ public short VariableTypes() (à la page 45) (types de données pris en charge par le contrôle)
- ▶ public MaxVariables() (à la page 46) (nombre maximal de variables pouvant être liées au contrôle.)

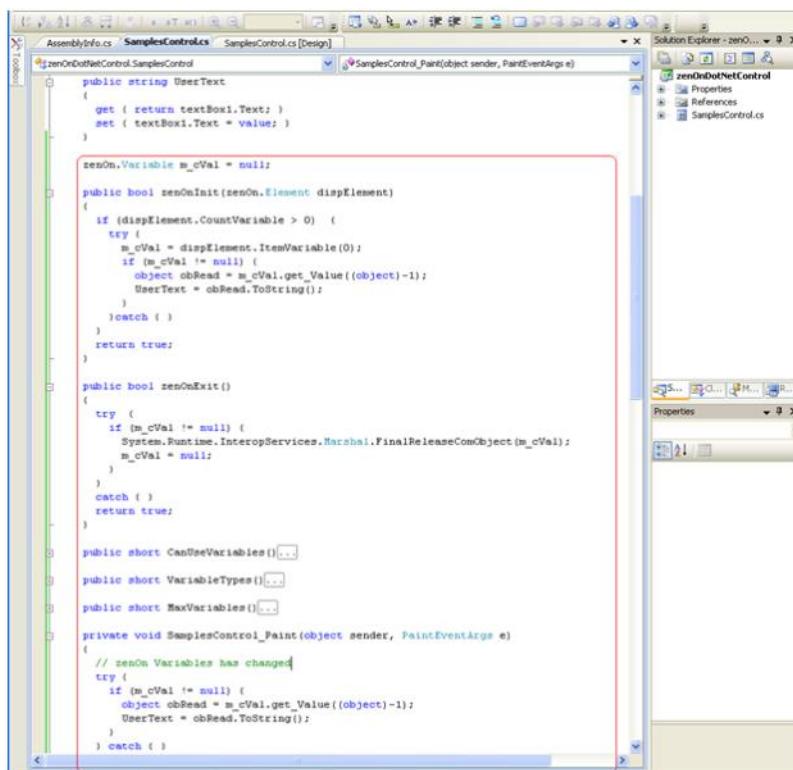

AJOUT DE RÉFÉRENCES

1. Dans Microsoft Visual Studio, sous **Ajouter des références**, sélectionnez la bibliothèque d'objets de zenon pour pouvoir accéder à l'API de zenon dans le contrôle.

2. Ajoutez les fonctions améliorées au code de classe du contrôle pour accéder à l'ensemble de l'API de zenon.

Dans notre exemple, l'objet COM d'une variable de zenon est temporairement enregistré dans un **membre**, afin d'être accessible ultérieurement via l'événement **Paint** du contrôle.

public bool zenOnInit(zenOn.Element dispElement)

Cette méthode (dans le Runtime) permet au contrôle ActiveX d'obtenir un pointeur vers l'interface de répartition de l'élément dynamique. Ce pointeur permet également d'accéder aux variables de zenon liées à l'élément dynamique.

Vous pouvez configurer l'ordre de transmission des variables dans la boîte de dialogue Entrer les propriétés, à l'aides des boutons **Bas** et **Haut**. La boîte de dialogue Entrer les propriétés s'affiche si :

- ▶ Vous double-cliquez sur l'élément ActiveX, ou
- ▶ Vous sélectionnez **Propriétés** dans le menu contextuel, ou
- ▶ Vous sélectionnez la propriété **Paramètres ActiveX** dans le noeud **Affichage** de la fenêtre de propriétés

public bool zenonInitED(zenon.Element dispElement)

Équivalent à **public bool zenonInit** (à la page 44) ; exécuté lors de l'ouverture d'ActiveX dans Editor (double-cliquez sur le contrôle ActiveX).

public bool zenOnExit()

Cette méthode est appelée par le Runtime de zenon lorsque le contrôle ActiveX est fermé. Ici, tous les pointeurs de répartition renvoyant à des variables doivent être libérés.

public bool zenonExitED()

Équivalent à public bool zenonExit() (à la page 45) ; exécuté lors de la fermeture d'ActiveX dans Editor. Permet de réagir aux changements (par exemple, aux modifications de valeurs) dans Editor.

public short CanUseVariables()

Cette méthode renvoie 1 si le contrôle peut utiliser les variables de zenon, et 0 dans le cas contraire.

- ▶ 1 : Pour l'élément dynamique (via le bouton **Variable**), vous pouvez uniquement déclarer des variables de zenon avec le type déclaré par le biais de la méthode **VariableTypes**, conformément au nombre défini par la méthode **MaxVariables**.
- ▶ 0 : si **CanUseVariables** renvoie 0 ou le contrôle ne comporte pas cette méthode, n'importe quel nombre de variables de tout type peut être défini, sans limitation aucune. Dans le Runtime, toutefois, ces variables sont uniquement utilisables avec du code VBA.

public short VariableTypes()

La valeur renvoyée par cette méthode est utilisée comme masque pour les types de variable utilisables dans la liste de variables. La valeur est une relation **AND** (et) parmi les valeurs suivantes (définies dans **zenon32/dy_type.h**) :

Paramètres	Valeur	Description
WORD	0x0001	correspond à la position 0
BYTE	0x0002	correspond à la position 1
BIT	0x0004	correspond à la position 2
DWORD	0x0008	correspond à la position 3
FLOAT	0x0010	correspond à la position 4
DFLOAT	0x0020	correspond à la position 5
STRING	0x0040	correspond à la position 6
IN_OUTPUT	0x8000	correspond à la position 15

public MaxVariables()

Dans cette section est défini le nombre de variables pouvant être sélectionnées dans la liste de variables.

¹ : la sélection multiple est désactivée dans la liste de variables. Un avertissement est alors affiché si plusieurs variables sont sélectionnées.

5. Contrôles utilisateur .NET

Le contrôle .NET permet d'améliorer de manière autonome les fonctionnalités du Runtime de zenon et d'Editor.

Dans ce manuel, vous trouverez des informations concernant :

- ▶ La différence entre un conteneur de contrôle et ActiveX (à la page 46)
- ▶ Exemple de conteneur de contrôle .NET (à la page 47)
- ▶ Exemple : contrôle .NET exécuté en tant que contrôle ActiveX (C#) (à la page 32)

Vous trouverez d'autres informations concernant les contrôles .NET dans ActiveX dans le manuel Synoptiques, au chapitre Contrôles .NET.

5.1 Différentes utilisations des contrôles .NET Control dans le conteneur de contrôles ou ActiveX

Un contrôle utilisateur .NET peut être :

- ▶ Intégré directement à l'élément ActiveX de zenon, via le contrôle CD_DotNetControlContainer
- ▶ Utilisé comme un contrôle ActiveX et intégré directement à l'élément ActiveX zenon

Principalement, les différences entre le contrôle de conteneur et le contrôle ActiveX sont les suivantes :

Contrôle CD_DotNetControlContainer	Contrôle Active X
▶ Ne doit pas être inscrit sur l'ordinateur.	▶ Doit être inscrit en tant que contrôle Active X sur l'ordinateur (regsvr32).
▶ En cas de modification du contrôleur, seule le fichier DLL doit être modifié.	▶ En cas de modification au niveau du contrôleur, l'élément TLB doit être réinscrit.
▶ L'accès via VBA et VSTA est uniquement possible par le biais de la méthode CD_DotNetControlContainer.	▶ Accès facile via VBA et VSTA.

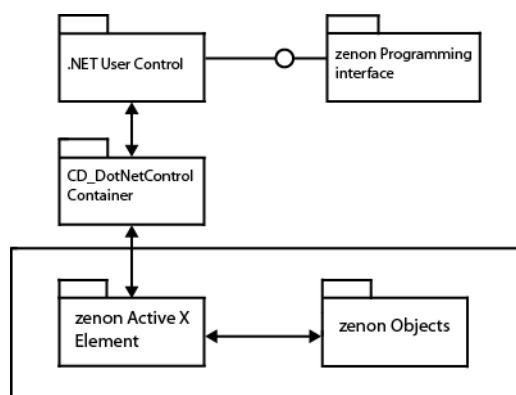

5.2 Exemple de conteneur de contrôle .NET

Dans ce didacticiel, vous allez découvrir comment créer un contrôle utilisateur .NET simple dans Visual Studio 2010 (langage de programmation **C#**) et comment l'intégrer, à l'aide du contrôle **CD_DotNetControlContainer** de zenon, sous forme de contrôle ActiveX dans un élément ActiveX de zenon.

5.2.1 Général

Le contrôle CD_DotNetControlContainer agit donc comme un wrapper entre le contrôle utilisateur et l'élément ActiveX de zenon. Toutes les méthodes utilisées dans l'exemple suivant, et toutes les méthodes publiques et propriétés sont transmises, via le contrôle CD_DotNetControlContainer, du contrôle utilisateur au contrôle ActiveX, et peuvent être utilisés par zenon (dans VBA et VSTA également).

Si une référence à l'interface de programmation de zenon est présente dans le contrôle utilisateur, vous pouvez directement accéder aux objets de >CD_PRODUCTNAME<.

Dans l'exemple suivant, nous allons :

- ▶ Créer un contrôle utilisateur .NET (à la page 49)
- ▶ Ajouter un conteneur CD_DotNetControlContainer et un contrôle utilisateur .NET (à la page 58)
- ▶ Autoriser l'accès au contrôle utilisateur via VSTA (VBA) (à la page 63)

CHEMIN DE LA DLL DANS EDITOR ET LE RUNTIME

Le chemin d'accès à **.Net DLL** sélectionné dans Editor est également utilisé dans le Runtime. Il est défini comme un chemin absolu, et ne peut pas être modifié.

Assurez-vous d'utiliser le même chemin sur tous les ordinateurs sur le réseau zenon pour Editor et le Runtime.

Conseil : Sélectionnez un chemin absolu, par exemple : C:\Controls. Saisissez le chemin tel qu'il est défini dans **Remote-Transport** et dans **.NET Control Container**. Utilisez **Remote-Transport** pour harmoniser ce chemin avec tous les ordinateurs.

public bool zenOnInit(zenOn.Element dispElement)

Cette méthode (dans le Runtime) permet au contrôle ActiveX d'obtenir un pointeur vers l'interface de répartition de l'élément dynamique. Ce pointeur permet également d'accéder aux variables de zenon liées à l'élément dynamique.

Vous pouvez configurer l'ordre de transmission des variables dans la boîte de dialogue Entrer les propriétés, à l'aides des boutons **Bas** et **Haut**. La boîte de dialogue Entrer les propriétés s'affiche si :

- ▶ Vous double-cliquez sur l'élément ActiveX, ou
- ▶ Vous sélectionnez **Propriétés** dans le menu contextuel, ou
- ▶ Vous sélectionnez la propriété **Paramètres ActiveX** dans le noeud **Affichage** de la fenêtre de propriétés

public bool zenOnExit()

Cette méthode est appelée par le Runtime de zenon lorsque le contrôle ActiveX est fermé. Ici, tous les pointeurs de répartition renvoyant à des variables doivent être libérés.

public short CanUseVariables()

Cette méthode renvoie 1 si le contrôle peut utiliser les variables de zenon, et 0 dans le cas contraire.

- ▶ 1 : Pour l'élément dynamique (via le bouton **Variable**), vous pouvez uniquement déclarer des variables de zenon avec le type déclaré par le biais de la méthode **VariableTypes**, conformément au nombre défini par la méthode **MaxVariables**.
- ▶ 0 : si **CanUseVariables** renvoie 0 ou le contrôle ne comporte pas cette méthode, n'importe quel nombre de variables de tout type peut être défini, sans limitation aucune. Dans le Runtime, toutefois, ces variables sont uniquement utilisables avec du code VBA.

public short VariableTypes()

La valeur renvoyée par cette méthode est utilisée comme masque pour les types de variable utilisables dans la liste de variables. La valeur est une relation **AND** (et) parmi les valeurs suivantes (définies dans **zenon32/dy_type.h**) :

Paramètres	Valeur	Description
WORD	0x0001	correspond à la position 0
BYTE	0x0002	correspond à la position 1
BIT	0x0004	correspond à la position 2
DWORD	0x0008	correspond à la position 3
FLOAT	0x0010	correspond à la position 4
DFLOAT	0x0020	correspond à la position 5
STRING	0x0040	correspond à la position 6
IN_OUTPUT	0x8000	correspond à la position 15

public MaxVariables()

Dans cette section est défini le nombre de variables pouvant être sélectionnées dans la liste de variables.

1 : la sélection multiple est désactivée dans la liste de variables. Un avertissement est alors affiché si plusieurs variables sont sélectionnées.

5.2.2 Créer un contrôle utilisateur .NET

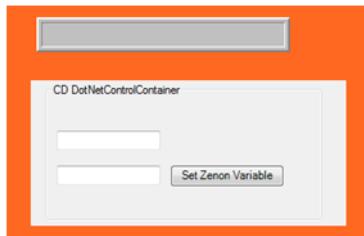

Un contrôle utilisateur est un contrôle simple, permettant de définir une nouvelle valeur par le biais d'un champ de saisie (champ de texte). Lorsque vous cliquez sur le bouton, la valeur est écrite dans la variable zenon de votre choix.

Une fonction supplémentaire doit automatiquement détecter tout changement de valeur de la variable dans zenon et afficher automatiquement la nouvelle valeur dans le contrôle.

Informations

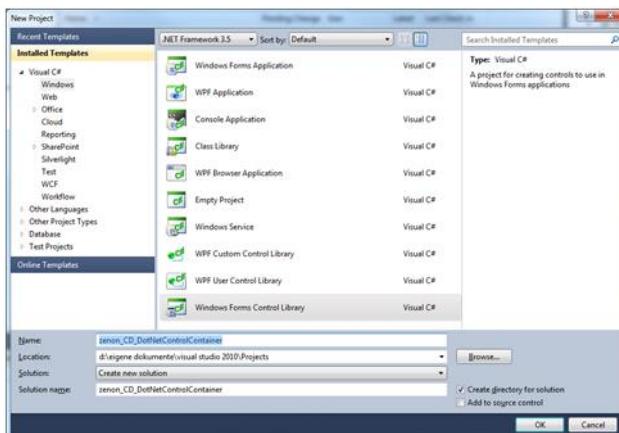

The screenshots for this theme are only available in English.

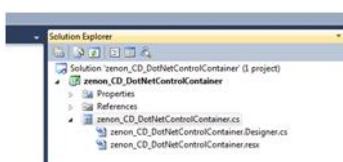

PROCÉDURE

- Créez d'abord un nouveau projet dans VS, et utilisez le type de projet **Bibliothèque de contrôles Windows Forms**

Important : spécifiez la version 3.5 de .NET Framework !

- Renommez ensuite le fichier CS de "UserControl" en "**zenon_CD_DotNetControlContainer.cs**". Les fichiers **Designer.cs** et **.resx** sont renommés automatiquement.

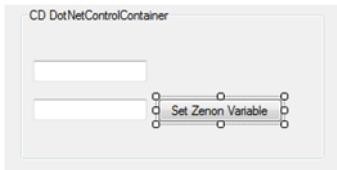

- À l'étape suivante, vous créez le contrôle utilisateur. Pour cela, utilisez deux champs de texte pour l'entrée et la sortie, respectivement, et un bouton permettant d'écrire de nouvelles valeurs dans la variable zenon.

Nom :

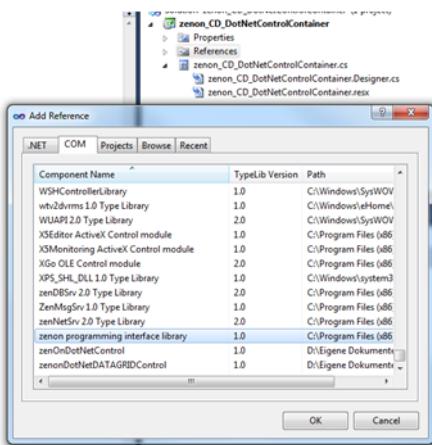

- Premier champ de texte : "**txtGetzenonVariable**"
- Deuxième champ de texte : "**txtSetzenonVariable**"

- Bouton : "btnSetzenonVariable"

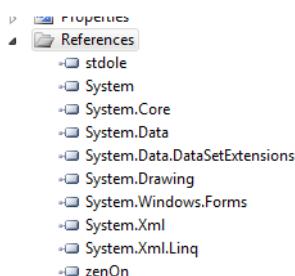

4. Pour accéder aux objets de zenon, vous devez disposer d'une référence à l'interface de programmation de zenon. Pour cela :

- Cliquez sur le nœud **Références** dans l'Explorateur de solutions
- Ouvrez menu contextuel
- Sélectionnez **Ajouter des références...**
- Sélectionnez l'onglet **COM**
- Sélectionnez **zenon programming interface library** (Bibliothèque d'interfaces de programmation de zenon)

La référence **zenon** devrait alors être visible dans la liste de références.

5. À l'étape suivante, créez une variable globale du type `zenon.variable` dans le code de **zenon_CD_DotNetControlContainer.cs** :

```

1  using System;
2  using System.Collections.Generic;
3  using System.ComponentModel;
4  using System.Drawing;
5  using System.Data;
6  using System.Linq;
7  using System.Text;
8  using System.Windows.Forms;
9  using zenOn;
10
11 namespace zenon_CD_DotNetControlContainer
12 {
13     public partial class zenon_CD_DotNetControlContainer : UserControl
14     {
15         //This will be needed to get the zenon Variable Container
16         zenOn.Variable _cVal = null;
17
18         public zenon_CD_DotNetControlContainer()
19         {
20             InitializeComponent();
21         }
22
23     }
24 }
25
26

```

6. Cette variable est initialisée par le biais de la méthode publique **zenonInit** :

```

23     /// <summary>
24     /// This public Method will be called by the initialization of the control during
25     /// the zenon Runtime.
26     /// </summary>
27     /// <param name="dispElement"></param>
28     /// <returns></returns>
29     public bool zenonInit(zenOn.Element dispElement)
30     {
31         //Check if zenon Variables are added to the
32         //Control
33         if (dispElement.CountVariable > 0)
34         {
35             try
36             {
37                 //Take the first zenon Variable and added
38                 //to the global Variable
39                 _cVal = dispElement.ItemVariable(0);
40                 //Set Value to the TextBox
41                 txtGetZenonVariable.Text = _cVal.get_Value(0).ToString();
42             }
43             catch { }
44         }
45     }
46

```

et activée via la méthode publique **zenonExit** :

```

47     /// <summary>
48     /// This public Method will be called by the release of the control during
49     /// the zenon Runtime.
50     /// </summary>
51     /// <returns></returns>
52     public bool zenonExit()
53     {
54         try
55         {
56             if (_cVal != null)
57             {
58                 //Release the zenon Variable (Com-Object)
59                 System.Runtime.InteropServices.Marshal.FinalReleaseComObject(_cVal);
60                 _cVal = null;
61             }
62         }
63         catch { }
64     }
65

```

Dans les méthodes suivantes, nous définissons si des variables et des types de données de zenon sont utilisés, ainsi que le nombre de variables pouvant être transmis :

```

107     /// <summary>
108     /// This public Method is needed to link zenon Variables
109     /// to the control.
110     /// </summary>
111     /// <returns></returns>
112     public short CanUseVariables()
113     {
114         return 1; // Only tis Variable is supported
115     }
116
117     /// <summary>
118     /// This public Method returns the Type of
119     /// supported zenon Variables
120     /// </summary>
121     /// <returns></returns>
122     public short VariableTypes()
123     {
124         return short.MaxValue; // all Data Types supported
125     }
126
127     /// <summary>
128     /// This public Method returns the number of
129     /// supported zenon Variables
130     /// </summary>
131     /// <returns></returns>
132     public short MaxVariables()
133     {
134         return 1; // Only 1 Variable should linked to the Control
135     }
136

```

7. À l'étape suivante, dans le paramètre **Click-Event** du bouton **btnSetzenonVariable**, définissez qu'un clic sur le bouton écrit la valeur du champ de texte **txtSetzenonVariable** dans la variable zenon, avant d'effacer le contenu du champ de texte.

```

98  /// <summary>
99   /// This will be triggered by clicking the Button. The new Value will
100  /// be set to the zenon Variable
101  /// </summary>
102  /// <param name="sender"></param>
103  /// <param name="e"></param>
104  private void btnSetZenonVariable_Click(object sender, EventArgs e)
105  {
106      //Set Value from TextBox to the zenon Variable
107      m_cVal.set_Value(0,txtSetZenonVariable.Text.ToString());
108      this.txtSetZenonVariable.Text = string.Empty;
109 }

```

8. Pour réagir à un changement de valeur de la variable, vous devez avoir accès à l'événement **Paint** du contrôle. L'événement **Paint** est également déclenché si la valeur de la variable initialisée de zenon change, et peut donc être utilisé pour actualiser des valeurs. Puisque les variables référencées dans l'élément ActiveX de zenon sont automatiquement suggérées, vous n'avez généralement pas besoin d'utiliser le conteneur **zenon.OnlineVariable** dans le contrôle.

```

111  /// <summary>
112  /// This will be triggered by painting the User Control or the Value of the Variable changed.
113  /// After the value of the Variable changed the Control will be new painted and the new Value
114  /// will be set to the Textbox.
115  /// </summary>
116  /// <param name="sender"></param>
117  /// <param name="e"></param>
118  private void zenon_CD_DotNetControlContainer_Paint(object sender, PaintEventArgs e)
119  {
120      if (m_cVal != null)
121      {
122          this.txtGetZenonVariable.Text = m_cVal.get_Value(0).ToString();
123          return;
124      }
125      else
126      {
127          this.txtGetZenonVariable.Text = "Variable Value";
128          return;
129      }
130  }

```

APERÇU DU CODE

Voici un récapitulatif de l'ensemble du code :

```

using System;

using System.Collections.Generic;

using System.ComponentModel;

using System.Drawing;

using System.Data;

using System.Linq;

using System.Text;

using System.Windows.Forms;

using zenOn;

namespace zenon_CD_DotNetControlContainer
{

```

```
public partial class zenon_CD_DotNetControlContainer : UserControl
{
    //Cette ligne est nécessaire pour accéder au conteneur de variable de zenon
    zenOn.Variable m_cVal = null;

    public zenon_CD_DotNetControlContainer()
    {
        InitializeComponent();
    }

    /// <summary>
    /// Cette méthode publique sera appelée par l'initialisation du contrôle dans
    /// le Runtime de zenon.
    /// </summary>
    /// <param name="dispElement"></param>
    /// <returns></returns>

    public bool zenOnInit(zenOn.Element dispElement)
    {
        //Vérifier si des variables de zenon ont été ajoutées au
        //Contrôle

        if (dispElement.CountVariable > 0)
        {
            try
            {
                //Prendre la première variable de zenon et l'ajouter
                //à la variable globale

                m_cVal = dispElement.ItemVariable(0);
            }
            catch { }

        }
        return true;
    }
}
```

```
/// <summary>
/// Cette méthode publique sera appelée par la libération du contrôle dans
/// le Runtime de zenon.
/// </summary>
/// <returns></returns>

{

    return short.MaxValue; // Tous les types de données pris en charge

}

/// <summary>
/// Cette méthode publique renvoie le nombre de
/// variables de zenon prises en charge
/// </summary>
/// <returns></returns>

public short MaxVariables()

{

    return 1; // Une seule variable doit être liée au contrôle

}

/// <summary>
/// Celle-ci sera déclenchée en cliquant sur le bouton. La nouvelle valeur sera
/// définie sur la variable de zenon
/// </summary>
/// <param name="sender"></param>
/// <param name="e"></param>

private void btnSetZenonVariable_Click(object sender, EventArgs e)

{

    //Valeur prescrite de TextBox pour la variable de zenon

    m_cVal.set_Value(0,txtSetZenonVariable.Text.ToString());

    this.txtSetZenonVariable.Text = string.Empty;

}

/// <summary>
/// Celle-ci sera déclenchée par le tracé du contrôle utilisateur ou la modification
de la valeur de la variable.
```

```

    /// Après la modification de la variable, le contrôle est tracé une nouvelle fois
    // et la nouvelle valeur

    /// est écrite dans le champ de texte.

    /// </summary>

    /// <param name="sender"></param>
    /// <param name="e"></param>

private void zenon_CD_DotNetControlContainer_Paint(object sender, PaintEventArgs e)

{

    if (m_cVal != null)

    {

        this.txtGetZenonVariable.Text = m_cVal.get_Value(0).ToString();

        return;

    }

    else

    {

        this.txtGetZenonVariable.Text = "Variable Value";

        return;

    }

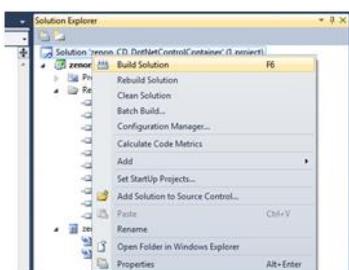

}

}

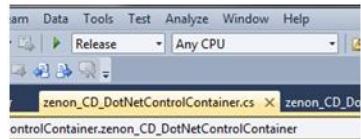

```

CRÉATION DE LA VERSION

Pour finir, créez une version pour intégrer la DLL finalisée dans zenon ou le conteneur **CD_DotNetControlContainer**.

Pour cela, vous devez basculer du mode **Débogage** au mode **Version finale** dans les paramètres.

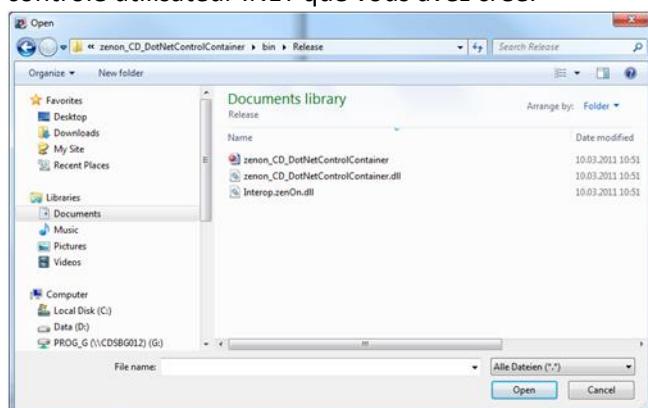

5.2.3 Ajouter un conteneur CD_DotNetControlContainer et un contrôle utilisateur .NET

Pour préparer le projet zenon et ajouter le conteneur **CD_DotNetControlContainer** et le **contrôle utilisateur .NET**, effectuez les étapes suivantes :

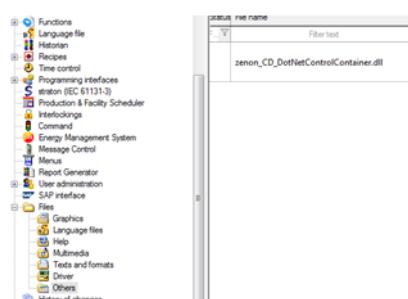

- Créez une variable interne de type `String` (Chaîne), et définissez la longueur de la chaîne sur 30.

- Dans le nœud **Projet/Fichiers/Autres** du projet zenon, ajoutez le fichier DLL du contrôle utilisateur .NET que vous avez créé.

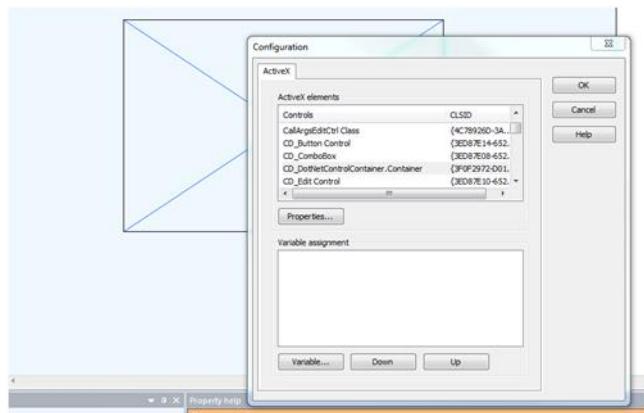

Le fichier DLL se trouve dans le dossier du projet de Visual Studio, sous `bin\Release\zenon_CD_DotNetControlContainer.dll`.

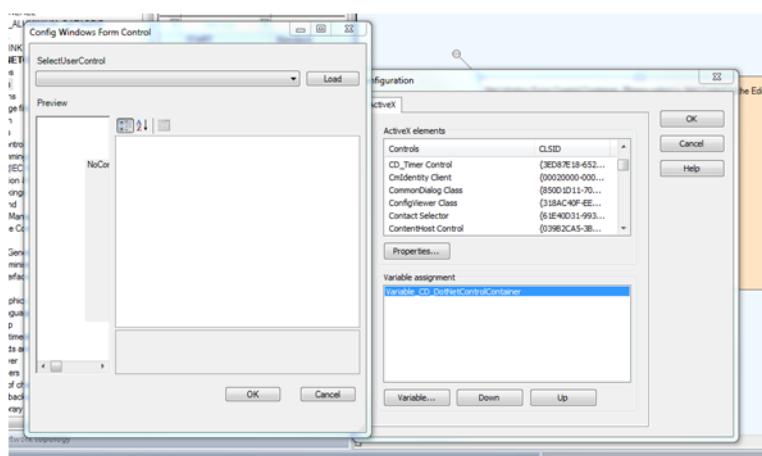

3. Dans le projet, sélectionnez l'élément ActiveX et faites-le glisser vers un synoptique zenon.

- La boîte de dialogue **Configuration** s'affiche à l'écran.
- Sélectionnez le contrôle **CD_DotNetControlContainer.Container**.

4. Pour incorporer le contrôle utilisateur .NET au contrôle **CD_DotNetControlContainer** :

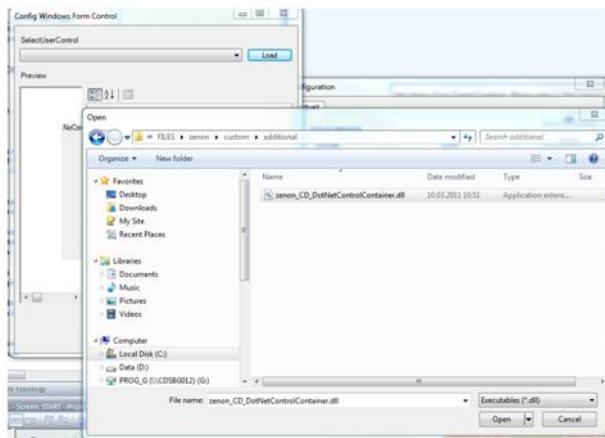

- Cliquez sur le bouton **Propriétés**.
- Une nouvelle boîte de dialogue s'affiche à l'écran.

- Cliquez sur le bouton **Charger** pour sélectionner le chemin du dossier du projet, par exemple :

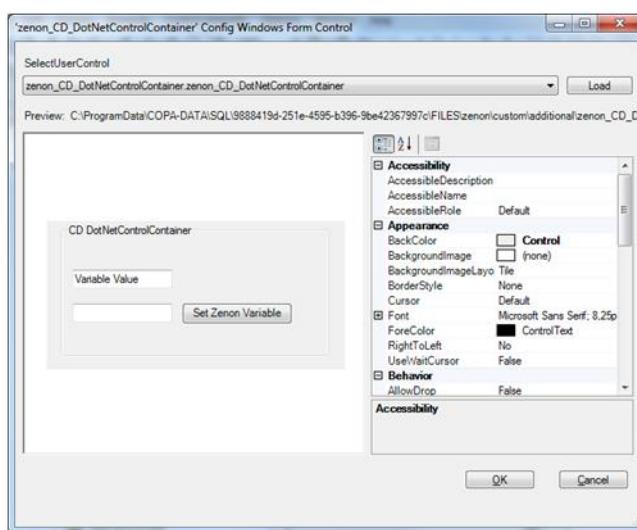

C:\ProgramData\COPA-DATA\SQL\9888419d-251e-4595-b396-9be423679
97c\FILES\zenon\custom\additional\zenon_CD_DotNetControlContai
ner.dll

En ajoutant le fichier DLL au dossier additional, le contrôle est automatiquement transféré lors de la copie ou du chargement des fichiers du Runtime vers un autre ordinateur. Le lien est alors perdu.

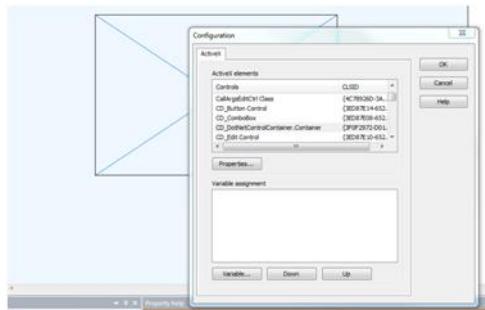

Le contrôle utilisateur .NET devrait maintenant être affiché.

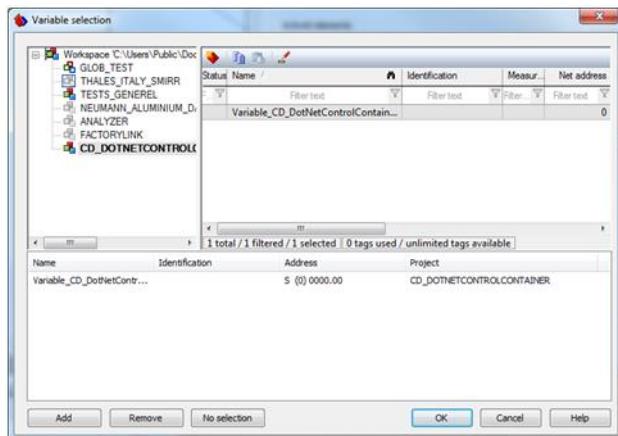

Fermez la boîte de dialogue en cliquant sur **OK**.

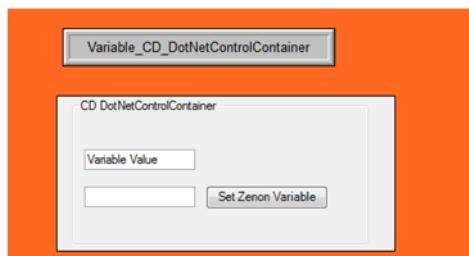

- À la dernière étape, liez une variable au contrôle en cliquant sur le bouton **Variables**.

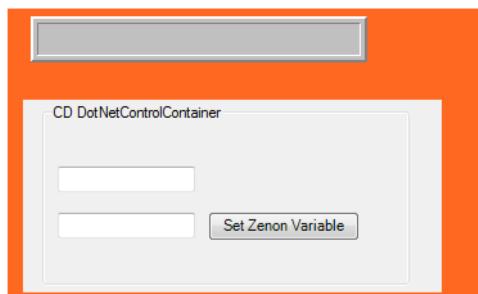

La variable sélectionnée est d'abord automatiquement liée avec notre variable globalement définie (.NET UserControl) via la méthode **publique zenonInit**. La liaison avec le contrôle est effectuée après le démarrage du Runtime.

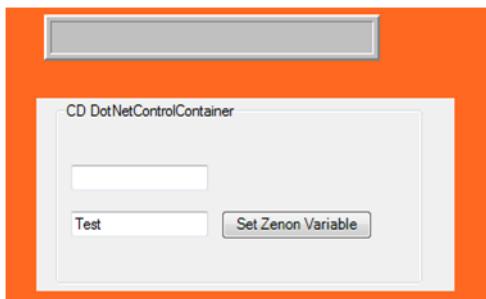

Liez ensuite la variable interne à un élément de texte.

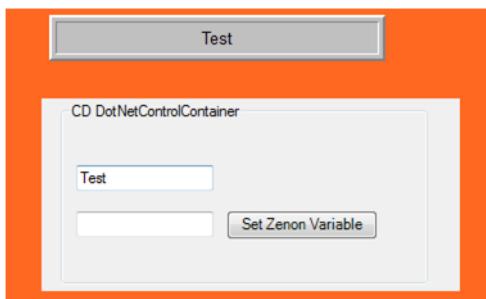

- Après le démarrage du Runtime, le contrôle est initialement vide.

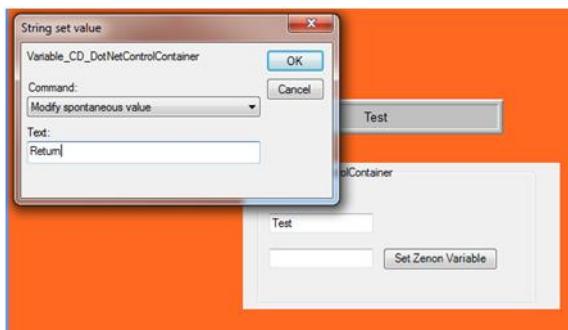

Si vous saisissez une valeur dans le deuxième champ de texte et la validez ensuite en cliquant sur le bouton **Set zenon variable** (Définir la variable de zenon), la valeur est écrite dans la variable zenon. (L'événement **btnSetzenonVariable_Click** est exécuté.)

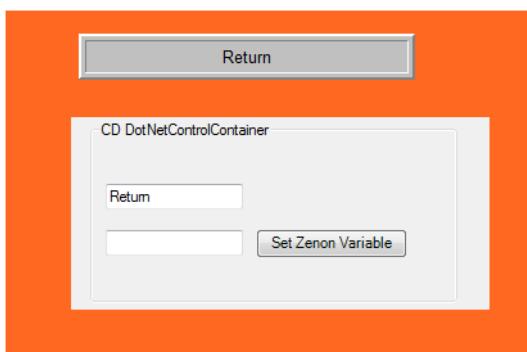

Cette indication est également affichée dans l'élément de texte de zenon.

Si la valeur est directement modifiée dans l'élément de texte de zenon,

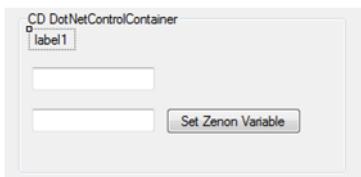

la valeur est directement écrite dans le premier champ de texte par le biais de l'événement **Paint** du contrôle .NET.

5.2.4 Accès au contrôle utilisateur via VSTA ou VBA

Ces exemples présentent l'accès via VSTA. La procédure est la même que pour VBA.

- Améliorez le contrôle en spécifiant un intitulé (**label**) et nommez-le **lblZenonInfo**. Dans cet intitulé, la valeur d'une autre variable de zenon doit être affichée. La nouvelle valeur doit être définie par le biais d'une macro VSTA.

- Améliorez le code avec une propriété (**Information**), et ajoutez à celle-ci les propriétés **get** et **set**. Elles vous permettent de lire et d'écrire le texte de l'intitulé.

```

13  public partial class zenon_CD_DotNetControlContainer : UserControl
14  {
15      //This will be needed to get the zenon Variable Container
16      zenon.Variable _m_cVal = null;
17
18      public zenon_CD_DotNetControlContainer()
19      {
20          InitializeComponent();
21      }
22
23      public string Information
24      {
25          set{this.lblZenonInfo.Text = value;}
26          get { return this.lblZenonInfo.Text; }
27      }
28

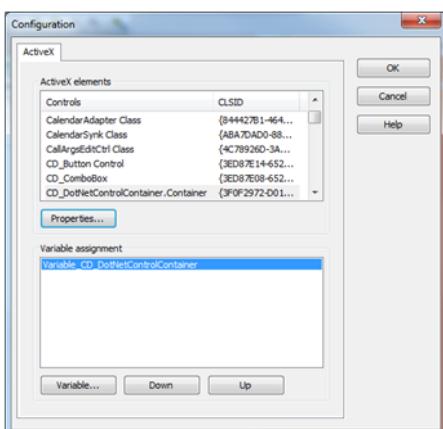

```

- Créez une nouvelle version du contrôle utilisateur et copiez-la vers le dossier **additional** du projet de zenon.

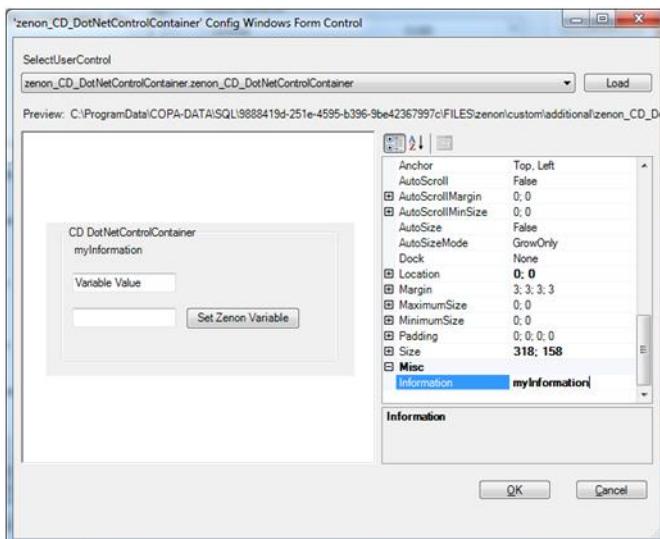

N'oubliez pas : Fermez zenon Editor avant d'effectuer cette manipulation !

Supprimez l'ancien fichier DLL, puis redémarrez zenon Editor. Si la DLL se trouve encore dans le dossier, supprimez-la simplement une deuxième fois. Vous pouvez maintenant importer la DLL modifiée. Les éléments **CD_DotNetContainerControl** et ActiveX sont mis à jour automatiquement.

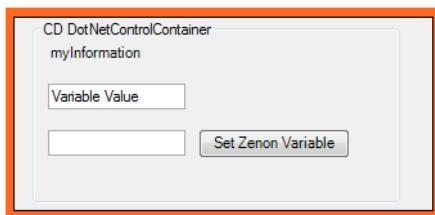

- Dans zenon Editor, cliquez sur ActiveX et ouvrez la fenêtre de la propriété.

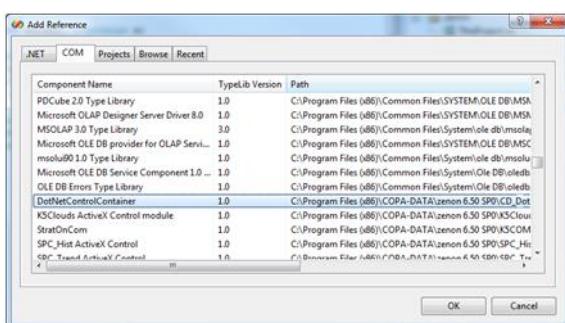

Vous pouvez maintenant voir la nouvelle propriété **Information** dans la fenêtre de sélection du contrôle, et vous pouvez également définir une valeur.

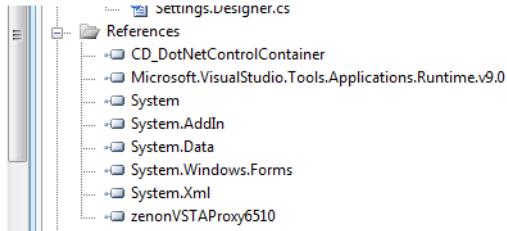

Cette valeur est également définie dans le contrôle ("myInformation").

- Pour pouvoir utiliser **CD_DotNetControlContainer** dans VSTA ou VBA, vous devez d'abord disposer de la référence du contrôle. Après avoir ouvert VSTA pour le projet (**ProjectAddin**), vous devez ajouter la référence de **CD_DotNetControlContainer**.

Vous devez en outre ajouter l'Assembly **System.Windows.Forms**.

6. Le code suivant permet de redéfinir la valeur de la propriété **Information**.

```
public void Macro_Test()
{
    try
    {
        zenOn.IElements zElements = this.DynPictures().Item("START").Elements();
        zenOn.IElement zElement = zElements.Item("ActiveX_1");

        // Create a Variable of Type CD_DotNetControlContainer.Container and get the zenon ActiveX Element
        // with a cast
        CD_DotNetControlContainer.Container zAktiveX = (CD_DotNetControlContainer.Container)zElement.AktiveX();

        //With using SetExternalUserControlProperty and the name of the Property "Information" we can set
        // a new Value "New Information" to the Property
        if (zAktiveX.GetExternalUserControlProperty("Information").Equals("myInformation"))
        {
            zAktiveX.SetExternalUserControlProperty("Information", "New Information");
        }
        else
        {
            zAktiveX.SetExternalUserControlProperty("Information", "myInformation");
        }
    }
    catch (Exception ex)
    {
        System.Diagnostics.Debug.Print("ERROR : " + ex.Message + " " + ex.Source);
    }
}
```

7. Pour finir :

- Créez une nouvelle fonction de zenon, intitulée **Exécuter macro VSTA**.
- Liez la fonction à un bouton.

Dans le Runtime, l'intitulé change de **myInformation** en **New Information** lorsque vous cliquez sur le bouton.

Cliquez à nouveau sur le bouton pour effectuer le changement inverse.

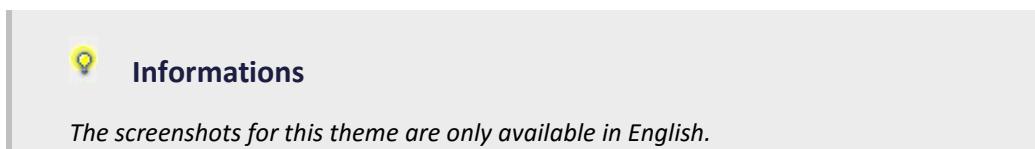

5.3 Exemple : contrôle .NET exécuté en tant que contrôle ActiveX (C#)

L'exemple suivant décrit un contrôle .NET exécuté comme un contrôle ActiveX dans zenon.

La création et l'intégration se déroulent en quatre étapes :

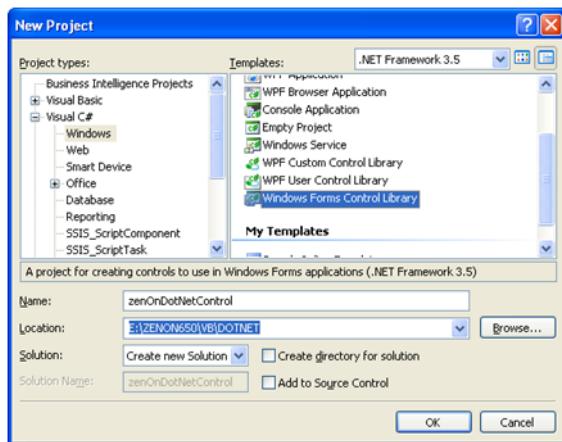

1. Création d'un contrôle de formulaire Windows (à la page 33)
2. Conversion d'un contrôle utilisateur .NET en double contrôle (à la page 36)
3. Utilisation avec ActiveX dans Editor via le code VBA (à la page 41)
4. Connexion de variables de zenon au contrôle utilisateur .NET (à la page 42)

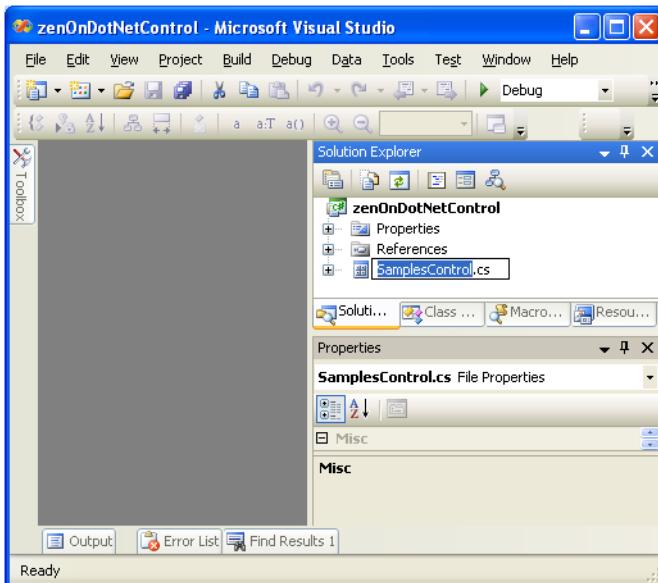

5.3.1 Crédit d'un contrôle de formulaire Windows

Pour créer un contrôle de formulaire Windows :

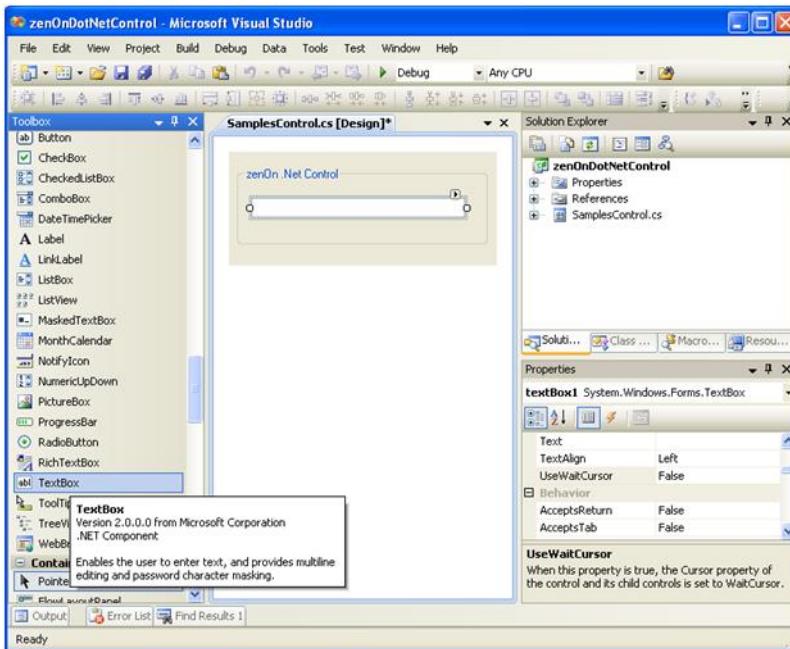

1. Démarrez Visual Studio 2008 et créez un nouveau projet **Windows Form Control Library** (Bibliothèque de contrôles de formulaire Windows) :

2. Renommez le contrôle par défaut avec le nom de contrôle souhaité.
Pour cet exemple : **SamplesControl.cs**.

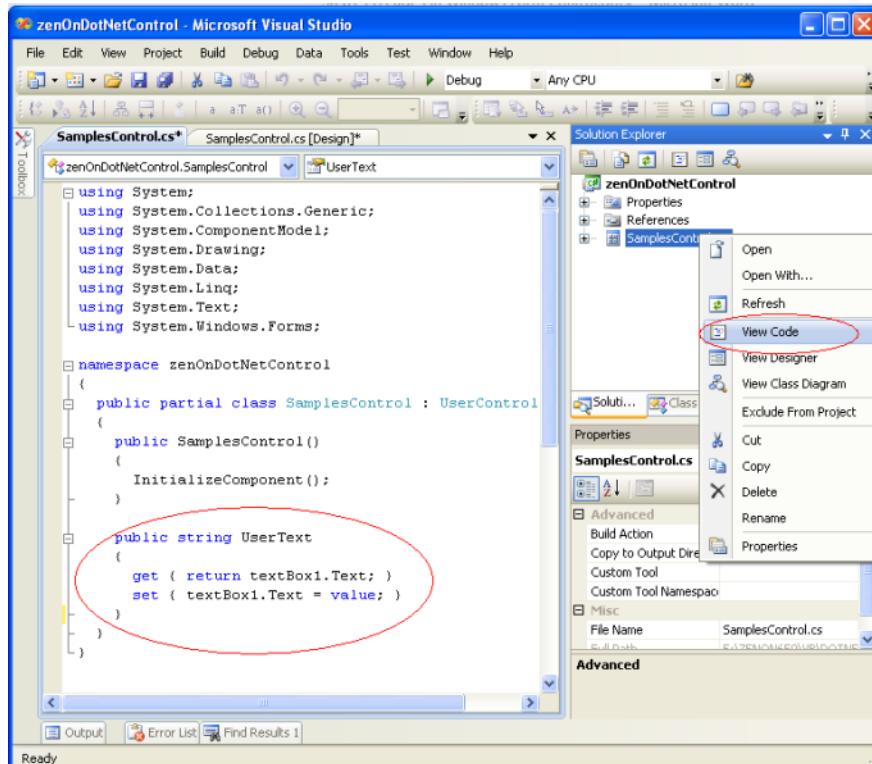

3. Ouvrez le concepteur de contrôles et ajoutez le contrôle souhaité (dans notre cas, un champ de texte) :

4. Les contrôles comportent normalement des propriétés. Ouvrez le concepteur de code en sélectionnant la fonction **Afficher le code**, puis ajoutez les propriétés devant que vous souhaitez rendre disponibles au niveau externe.

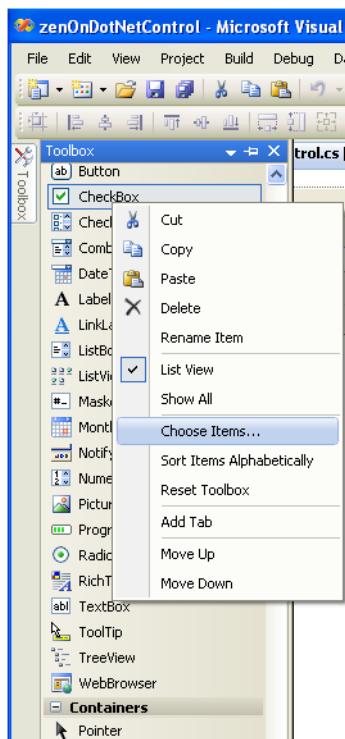

Pour cet exemple : la propriété visible au niveau externe "**UserText**", avec l'accès **get** et **set**, qui contient le texte du champ de texte :

5. Compilez le projet.

Le contrôle de formulaire Windows peut maintenant être utilisé dans d'autres projets de formulaires Windows.

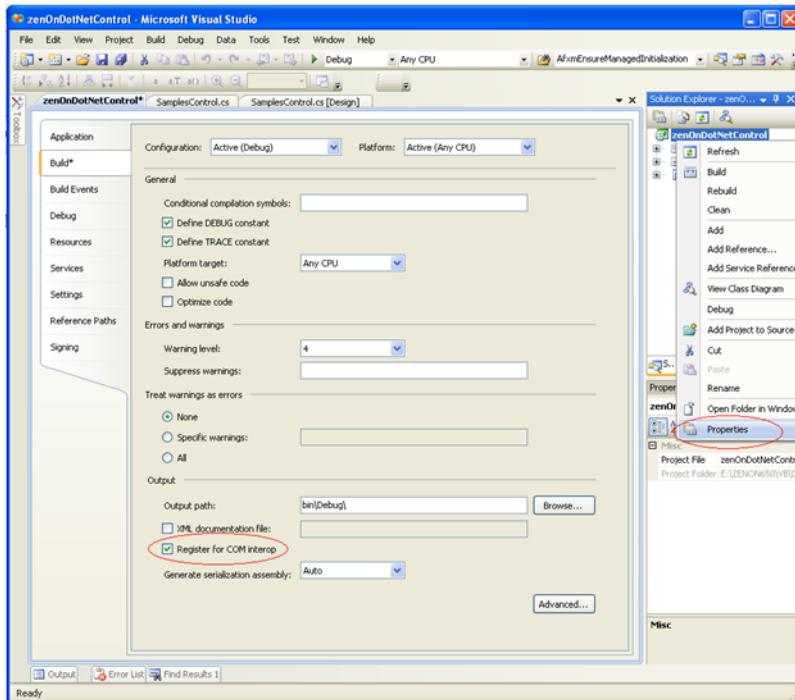

Important : le contrôle doit être inséré manuellement dans la boîte à outils de contrôle par le biais de la fonction **Choisir les éléments**.

5.3.2 Conversion d'un contrôle utilisateur .NET en double contrôle

Pour convertir un contrôle .NET en double contrôle, vous devez d'abord activer l'interface COM pour ActiveX.

1. Ouvrez le projet et activez la propriété **Inscrire pour COM interop** dans les paramètres **Générer** :

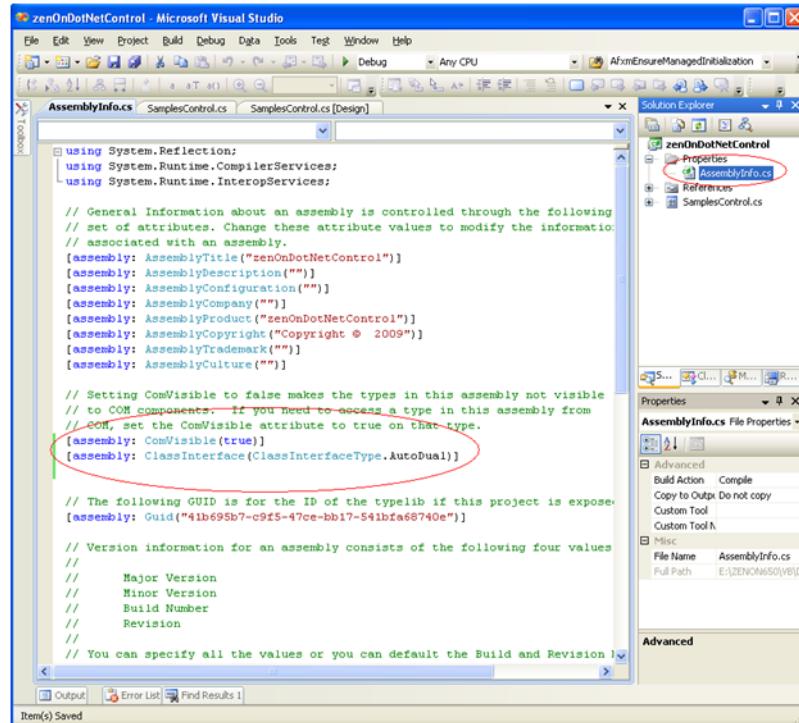

2. Ouvrez le fichier **AssemblyInfo.cs** et

- définissez l'attribut **ComVisible** sur **true**
- ajoutez l'attribut **ClassInterface**

```
[assembly: ComVisible(true)]
```

[assembly: ClassInterface(ClassInterfaceType.AutoDual)]

```

using System.Reflection;
using System.Runtime.CompilerServices;
using System.Runtime.InteropServices;

// General Information about an assembly is controlled through the following
// set of attributes. Change these attribute values to modify the information
// associated with an assembly.
[assembly: AssemblyTitle("zenOnDotNetControl")]
[assembly: AssemblyDescription("")]
[assembly: AssemblyConfiguration("")]
[assembly: AssemblyCompany("")]
[assembly: AssemblyProduct("zenOnDotNetControl")]
[assembly: AssemblyCopyright("Copyright © 2009")]
[assembly: AssemblyTrademark("")]
[assembly: AssemblyCulture("")]

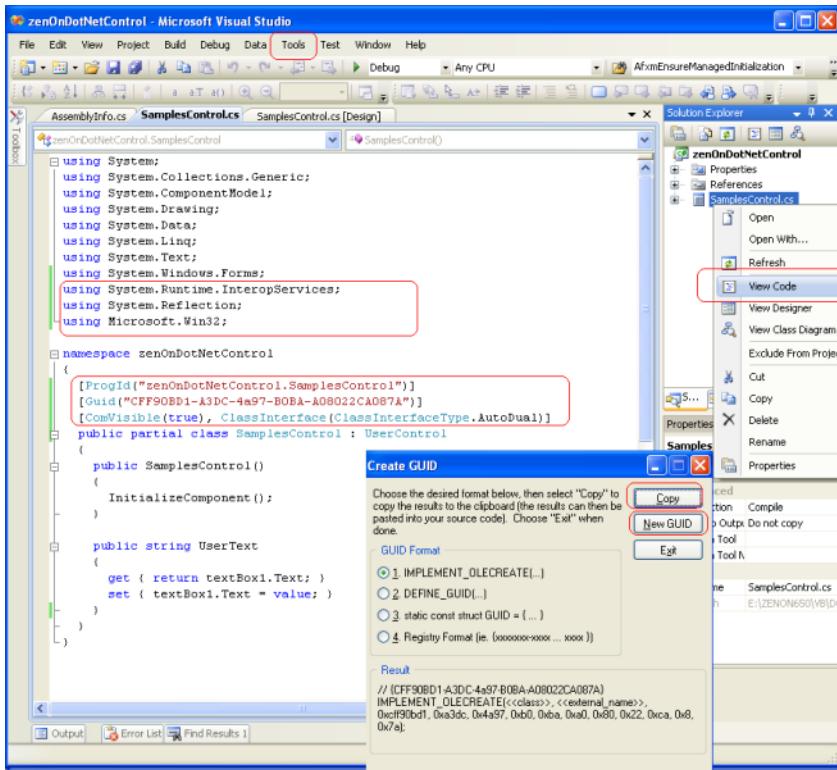

// Setting ComVisible to false makes the types in this assembly not visible
// to COM components. If you need to access a type in this assembly from
// COM, set the ComVisible attribute to true on that type.
[assembly: ComVisible(true)]
[assembly: ClassInterface(ClassInterfaceType.AutoDual)]

// The following GUID is for the ID of the typelib if this project is exposed
// to COM.
[assembly: Guid("41b695b7-c9f5-47ce-bb17-541bfa68740e")]

// Version information for an assembly consists of the following four values
//
// Major Version
// Minor Version
// Build Number
// Revision
//
// You can specify all the values or you can default the Build and Revision

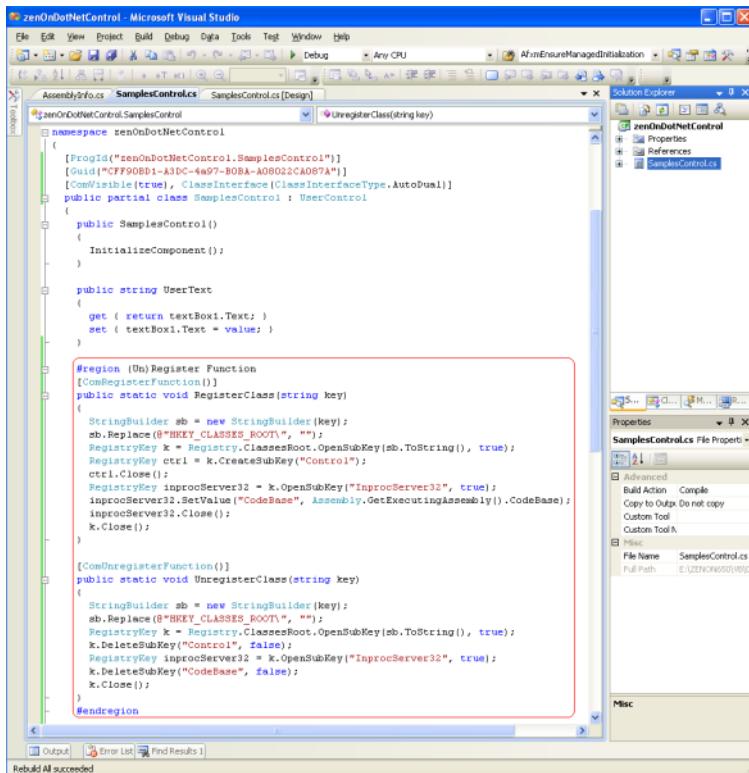

```

3. Ouvrez le concepteur de code en sélectionnant l'option **Afficher le code**, puis ajoutez les attributs ActiveX et les entrées **using** requis. Dans le menu **Outils/Create GUID**, créez un nouveau GUID pour l'attribut GUID :

4. Pour que le contrôle puisse être sélectionné comme un contrôle d'interface utilisateur Active X, vous devez ajouter des fonctions aux classes de contrôle suivantes :
- RegisterClass

- UnregisterClass

```

namespace zenOnDotNetControl
{
    [ProgId("zenOnDotNetControl.SamplesControl")]
    [Guid("CFF90B51-A3DC-4a97-B0BA-A08022CA087A")]
    [ComVisible(true), ClassInterface(ClassInterfaceType.AutoDual)]
    public partial class SamplesControl : UserControl
    {
        public SamplesControl()
        {
            InitializeComponent();
        }

        public string UserText
        {
            get { return textBox1.Text; }
            set { textBox1.Text = value; }
        }

        #region (Un)Register Function
        [ComRegisterFunction()]
        public static void RegisterClass(string key)
        {
            Stringbuilder sb = new Stringbuilder(key);
            sb.Replace(@"HKEY_CLASSES_ROOT\", "");
            RegistryKey k = Registry.ClassesRoot.OpenSubKey(sb.ToString(), true);
            RegistryKey ctrl = k.CreateSubKey("Control");
            ctrl.Close();
            RegistryKey inprocServer32 = k.OpenSubKey("InprocServer32", true);
            inprocServer32.SetValue("CodeBase", Assembly.GetExecutingAssembly().CodeBase);
            inprocServer32.Close();
            k.Close();
        }

        [ComUnregisterFunction()]
        public static void UnregisterClass(string key)
        {
            Stringbuilder sb = new Stringbuilder(key);
            sb.Replace(@"HKEY_CLASSES_ROOT\", "");
            RegistryKey k = Registry.ClassesRoot.OpenSubKey(sb.ToString(), true);
            k.DeleteSubKey("Control", false);
            RegistryKey inprocServer32 = k.OpenSubKey("InprocServer32", true);
            k.DeleteSubKey("CodeBase", false);
            k.Close();
        }
        #endregion
    }
}

```

Vous pouvez ensuite inscrire le contrôle dans la base de registres.

5. Recompilez le projet.

Le contrôle de formulaire Windows est maintenant utilisable dans ActiveX, et a été inscrit automatiquement durant la création de la nouvelle version. Un fichier typelib supplémentaire, **zenonDotNetControl.tlb**, a été créé dans le répertoire de sortie.

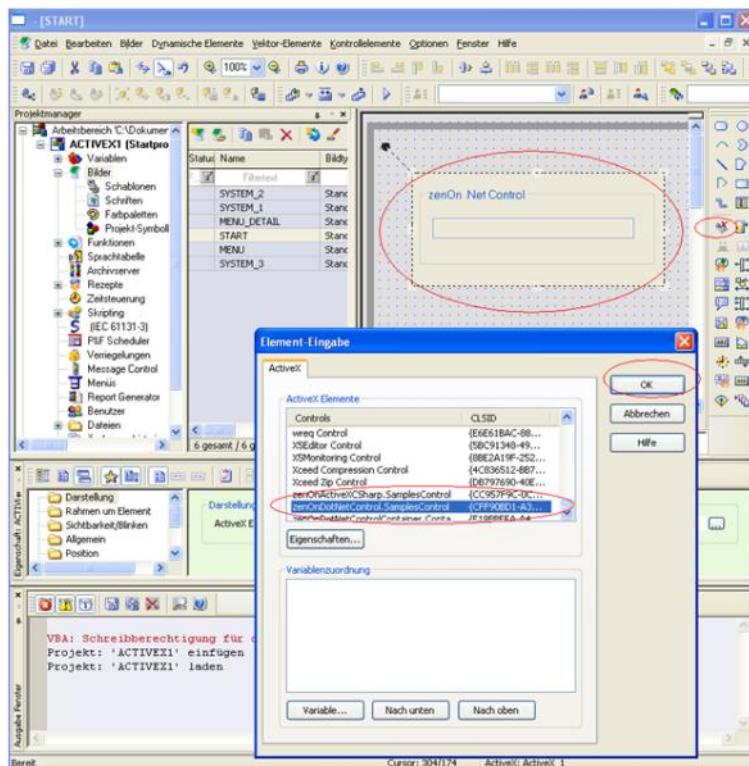

6. Pour utiliser le contrôle sur un autre ordinateur :

a) Copiez le fichier DLL et le fichier TLB sur l'ordinateur cible

b) Enregistrez les fichiers en saisissant la ligne de commande :

```
%windir%\Microsoft.NET\Framework\v2.0.50727\regasm.exe zenonDotNetControl.dll
/tlb:zenonDotNetControl.tlb
```

7. Ajoutez le contrôle de formulaire étendu de Windows en tant que contrôle ActiveX dans zenon Editor :

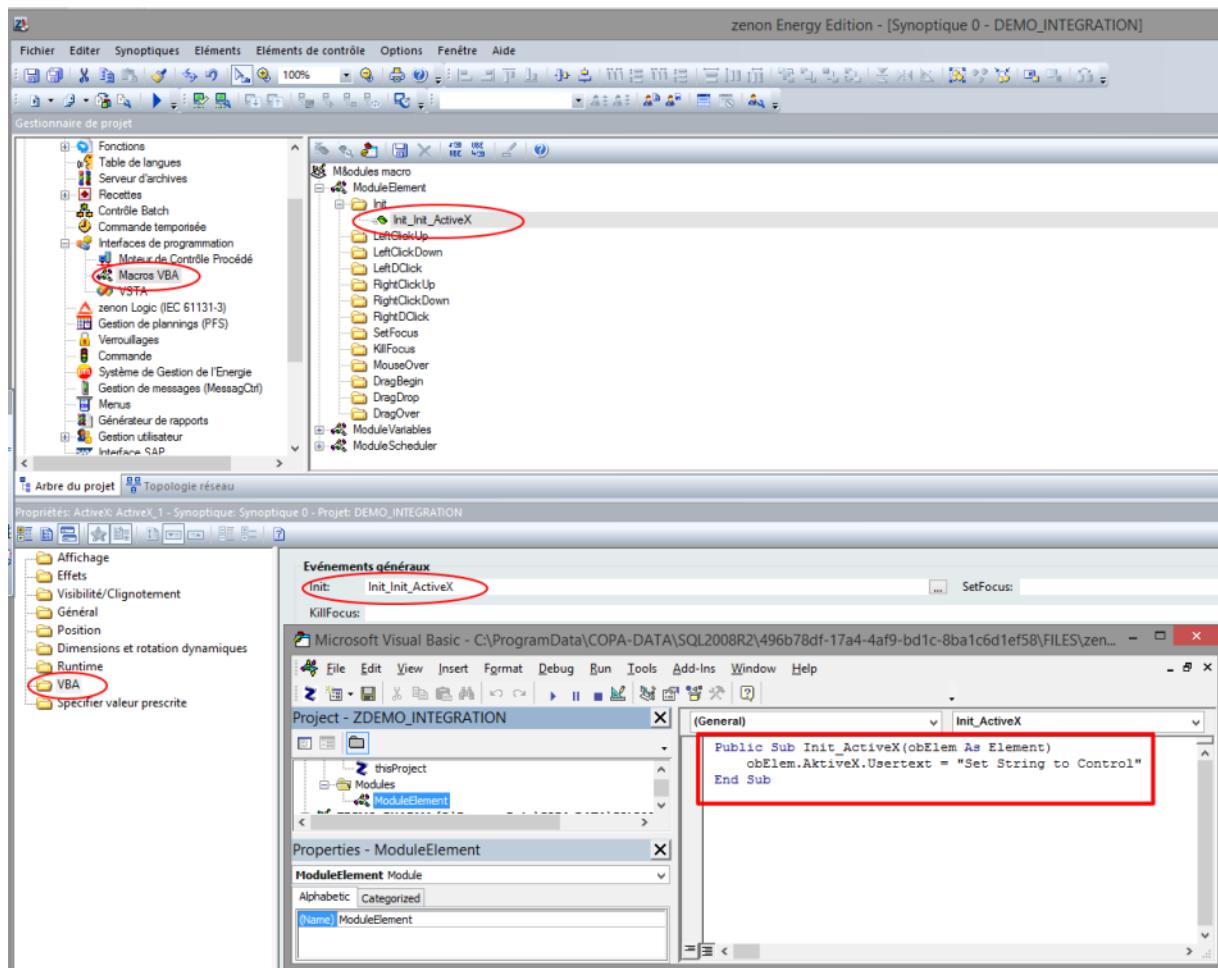

5.3.3 Utilisation avec ActiveX dans Editor via le code VBA

Pour accéder aux propriétés du contrôle dans zenon Editor :

1. Dans zenon Editor, dans le nœud **Interfaces de programmation/Macros VBA**, créez une nouvelle macro **Init** avec le nom **Init_ActiveX**.

Dans cette macro, vous pouvez accéder à toutes les propriétés externes via **obElem.ActiveX**.

2. Attribuez cette macro au contrôle ActiveX via les propriétés **macros VBA/Init** de l'élément ActiveX.

EXAMPLE DE MACRO INIT

```

Public Sub Init_ActiveX(obElem As Element)
    obElem.AktiveX.UserText = "Attribuez la chaîne au contrôle"
End Sub

```

5.3.4 Connexion de variables de zenon au contrôle utilisateur .NET

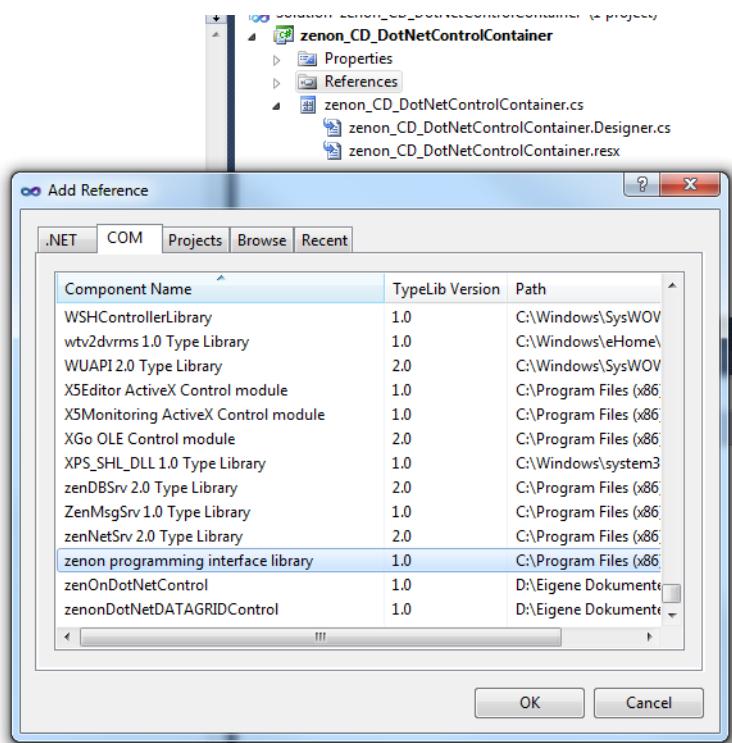

Dans zenon, vous avez la possibilité d'améliorer un contrôle ActiveX avec des fonctions spéciales pour accéder à l'API zenon.

MÉTHODES REQUISÉES

- ▶ public bool zenonInit (à la page 44) (appelé durant l'initialisation du contrôle dans le Runtime de zenon.)
- ▶ public bool zenonInitED (à la page 44) (utilisé dans Editor.)
- ▶ public bool zenonExit() (à la page 45) (appelé lors de la destruction du contrôle dans le Runtime de zenon.)
- ▶ public bool zenonExitED() (à la page 45) (utilisé dans Editor.)
- ▶ public short CanUseVariables() (à la page 45) (prend en charge la liaison de variables.)
- ▶ public short VariableTypes() (à la page 45) (types de données pris en charge par le contrôle)
- ▶ public MaxVariables() (à la page 46) (nombre maximal de variables pouvant être liées au contrôle.)

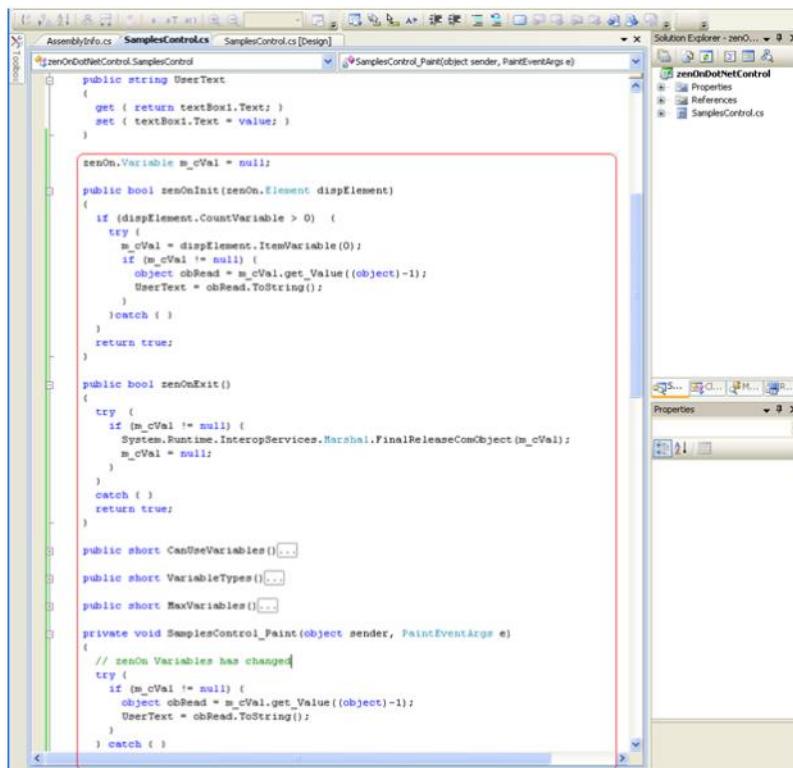

AJOUT DE RÉFÉRENCES

1. Dans Microsoft Visual Studio, sous **Ajouter des références**, sélectionnez la bibliothèque d'objets de zenon pour pouvoir accéder à l'API de zenon dans le contrôle.

2. Ajoutez les fonctions améliorées au code de classe du contrôle pour accéder à l'ensemble de l'API de zenon.

Dans notre exemple, l'objet COM d'une variable de zenon est temporairement enregistré dans un **membre**, afin d'être accessible ultérieurement via l'événement **Paint** du contrôle.

public bool zenOnInit(zenOn.Element dispElement)

Cette méthode (dans le Runtime) permet au contrôle ActiveX d'obtenir un pointeur vers l'interface de répartition de l'élément dynamique. Ce pointeur permet également d'accéder aux variables de zenon liées à l'élément dynamique.

Vous pouvez configurer l'ordre de transmission des variables dans la boîte de dialogue Entrer les propriétés, à l'aides des boutons **Bas** et **Haut**. La boîte de dialogue Entrer les propriétés s'affiche si :

- ▶ Vous double-cliquez sur l'élément ActiveX, ou
- ▶ Vous sélectionnez **Propriétés** dans le menu contextuel, ou
- ▶ Vous sélectionnez la propriété **Paramètres ActiveX** dans le noeud **Affichage** de la fenêtre de propriétés

public bool zenonInitED(zenon.Element dispElement)

Équivalent à **public bool zenonInit** (à la page 44) ; exécuté lors de l'ouverture d'ActiveX dans Editor (double-cliquez sur le contrôle ActiveX).

public bool zenOnExit()

Cette méthode est appelée par le Runtime de zenon lorsque le contrôle ActiveX est fermé. Ici, tous les pointeurs de répartition renvoyant à des variables doivent être libérés.

public bool zenonExitED()

Équivalent à public bool zenonExit() (à la page 45) ; exécuté lors de la fermeture d'ActiveX dans Editor. Permet de réagir aux changements (par exemple, aux modifications de valeurs) dans Editor.

public short CanUseVariables()

Cette méthode renvoie 1 si le contrôle peut utiliser les variables de zenon, et 0 dans le cas contraire.

- ▶ 1 : Pour l'élément dynamique (via le bouton **Variable**), vous pouvez uniquement déclarer des variables de zenon avec le type déclaré par le biais de la méthode **VariableTypes**, conformément au nombre défini par la méthode **MaxVariables**.
- ▶ 0 : si **CanUseVariables** renvoie 0 ou le contrôle ne comporte pas cette méthode, n'importe quel nombre de variables de tout type peut être défini, sans limitation aucune. Dans le Runtime, toutefois, ces variables sont uniquement utilisables avec du code VBA.

public short VariableTypes()

La valeur renvoyée par cette méthode est utilisée comme masque pour les types de variable utilisables dans la liste de variables. La valeur est une relation **AND** (et) parmi les valeurs suivantes (définies dans **zenon32/dy_type.h**) :

Paramètres	Valeur	Description
WORD	0x0001	correspond à la position 0
BYTE	0x0002	correspond à la position 1
BIT	0x0004	correspond à la position 2
DWORD	0x0008	correspond à la position 3
FLOAT	0x0010	correspond à la position 4
DFLOAT	0x0020	correspond à la position 5
STRING	0x0040	correspond à la position 6
IN_OUTPUT	0x8000	correspond à la position 15

public MaxVariables()

Dans cette section est défini le nombre de variables pouvant être sélectionnées dans la liste de variables.

1 : la sélection multiple est désactivée dans la liste de variables. Un avertissement est alors affiché si plusieurs variables sont sélectionnées.

6. WPF element

With the **WPF** dynamic element, valid WPF/XAML files in zenon can be integrated and displayed.

Informations

All brand and product names in this documentation are trademarks or registered trademarks of the respective title holder.

6.1 Basics

XAML

XAML stands for **Extensible Application Markup Language**. The XML-based descriptive text developed by Microsoft defines graphic elements, animations, transformations, displays of color gradients etc. in Silverlight and WPF user interfaces. The use of XAML makes it possible to strictly separate design and programming. The designer prepares, for example, the graphical user interface and creates basic animations that are then used by the developers/project planners who create the application logic.

WPF

WPF stands for Windows Presentation Foundation and describes a graphics framework that is part of the Windows .NET framework:

- ▶ WPF provides a comprehensive model for the programmer.
- ▶ XAML describes, based on XML, the interface hierarchy as a markup language. Depending on the construction of the XAML file, there is the possibility to link properties, events and transformations of WPF elements with variables and functions of CD_PRODUCTNAME<.

- The framework unites the different areas of presentation such as user interface, drawing, graphics, audio, video, documents and typography.

For execution in zenon, Microsoft .NET framework version 3.5 or higher is required.

6.1.1 WPF in process visualization

XAML makes different design possibilities possible for zenon. Display elements and dynamic elements can be adapted graphically regardless of the project planning. For example, laborious illustrations are first created by designers and then imported into zenon as an XAML file and linked to the desired logic. There are many possibilities for using this, for example:

DYNAMIC ELEMENTS IN ANALOG-LOOK

Graphics no longer need to be drawn in zenon, but can be imported directly as an XAML file. This makes it possible to use complex, elaborately illustrated elements in process visualization. Reflections, shading, 3D effects etc. are supported as graphics. The elements that are adapted to the respective industry environment make intuitive operation possible, along the lines of the operating elements of the machine.

INTRICATE ILLUSTRATIONS FOR INTUITIVE OPERATION

The integration of XAML-based display elements improves the graphics of projects and makes it very easy to display processes clearly. Elements optimized for usability make operation easier. A clear display of data makes it easier to receive complex content. The flexible options for adapting individual elements makes it easier to use for the operator. It is therefore possible for the project planners to determine display values, scales and units on their own.

CLEAR PRESENTATION OF DATA AND SUMMARIES

Grouped display elements make it possible to clearly display the most important process data, so that the equipment operator is always informed of the current process workflow. Graphical evaluations, display values and sliders can be grouped into an element and make quick and uncomplicated control possible.

INDUSTRY-SPECIFIC DISPLAYS

Elements such as thermometers, scales or bar graphs are part of the basic elements of process visualization. It is possible, using XAML, to adapt these to the respective industry. Thus equipment operators can find the established and usual elements that they already know from the machines in process visualization at the terminal.

ADAPTATION TO CORPORATE DESIGN

Illustrations can be adapted to the respective style requirements of the company, in order to achieve a consistent appearance through to the individual process screen. For example, the standard operation elements from zenon can be used, which can then be adapted to color worlds, house fonts and illustration styles of the corporate design.

6.1.2 Referenced assemblies

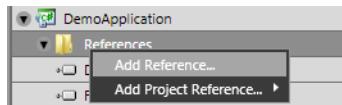

It is not just standard objects (rectangles, graphics, etc.) or effects (color gradients, animations, etc.) that can be displayed using the **WPF elements**, but also customized user controls (with logic in the code behind), which are referenced as assemblies.

For example, a user control that looks like a tacho and provides special properties and optical effects can be created, such as a "Value" property, which causes the pointer of the tacho to move and/or the corresponding value to be displayed in a label.

The workflow for this:

- ▶ The appearance of a user controls is labeled with standard objects, which are offered by WPF.
- ▶ The properties and interactions are programmed.
- ▶ The whole package is compiled and present in the form of a .NET assembly.

This assembly can also be used for WPF projects. To do this, it must be referenced (linked) in the WPF editor (for example: Microsoft Expression Blend). To do this, select the assembly in the zenon file selection dialog:

From this point in time, the WPF user controls of the assembly in the tool box can be selected under **Custom user controls** and used in the WPF project.

See also, in relation to this, the following chapter: Guidelines for developers (à la page 96).

USED REFERENCED ASSEMBLIES IN ZENON

To use an assembly in zenon, this must be provided as a file.

Collective files in **.cdwpf** format administer these independently; no further configuration is necessary.

Assemblies must be added to the **Files** folder for .xaml files:

- ▶ Click on **Files** on the project tree
- ▶ Select **Other**
- ▶ Select **Add file...** in the context menu
- ▶ The configuration dialog opens
- ▶ Insert the desired assembly

When displaying a WPF file in the **WPF element** (Editor and Runtime), the assemblies from this folder are loaded. It is thus also ensured that when the Runtime files are transferred using **Remote Transport**, all referenced assemblies are present on the target computer.

A collective file (**.cdwpf**) can exist alongside an XAML file with the same name. All assemblies (*.dll) from all collective files and the **Other** folder are copied to the work folder. Only the highest file version is used if there are several assemblies with the same name.

Attention

Assemblies are only removed after loading when the application is ended. This means:

*If a WPF file with a referenced assembly in zenon is displayed, then this assembly is loaded in the memory until zenon is ended, even if the screen is closed again. If you would like to remove an assembly from the **Files/Other** folder, the Editor must first be restarted, so that the assembly is removed.*

MULTI-PROJECT ADMINISTRATION

With multi-project administration, the same assembly must be used in all projects. If an assembly is replaced by another version in a project, it must also be replaced in all other projects that are loaded in the Editor or in Runtime.

6.1.3 Workflows

The WPF/XAML technology makes new workflows in process visualization possible. The separation of design and functionality ensures a clear distinction of roles between the project engineer and designers; design tasks can be easily fulfilled by using pre-existing designs, which no longer need to be modified by the project engineer.

The following people are involved in the workflow to create WPF elements in zenon:

- ▶ Designer
 - illustrates elements
 - takes care of the graphics for MS Expression Design
- ▶ MS Expression Blend operator
 - Animates elements
 - Creates variables for the animation of WPF elements in zenon, which project engineer can access
- ▶ Project engineer
 - Integrates elements into zenon:
 - stores logic and functionality

We make a distinction:

- ▶ Workflow with Microsoft Expression Blend (à la page 83)
- ▶ Workflow with Adobe Illustrator (à la page 84)

Workflow with Microsoft Expression Blend

When using Microsoft Expression Blend, a WPF element is created in four stages:

1. Illustration of elements in **MS Expression Blend** (à la page 85)
2. Open element in **MS Expression Design** and export as WPF
3. Animation in **MS Expression Blend** (à la page 85)
4. Integration into zenon (à la page 170)

You can find an example for creating a WPF elements with Microsoft Expression Blend in the Create button as XAML file with Microsoft Expression Blend (à la page 85) chapter.

Workflow with Adobe Illustrator

Based on traditional design processes with **Adobe Illustrator** the following workflow is available:

1. Illustration of elements in **Adobe Illustrator** (à la page 89)
2. Import of .ai files and preparation in **MS Expression Design** (à la page 90)
3. WPF export from **MS Expression Design** (à la page 90)
4. Animation in **MS Expression Blend** (à la page 92)
5. Integration into zenon (à la page 164)

You can find an example for creation in the Workflow with Adobe Illustrator (à la page 88) chapter.

6.2 Guidelines for designers

This section informs you how to correctly create WPF files in Microsoft Expression Blend and Adobe Illustrator. The tutorials on Creating a button element (à la page 85) and a bar graph element (à la page 88) show you how fully functional WPF files for zenon can be created from pre-existing graphics in a few steps.

The following tools were used for this:

- ▶ Adobe Illustrator CS3 (AI)
- ▶ Microsoft Expression Design 4 (ED)
- ▶ Microsoft Expression Blend 4 (EB)
- ▶ zenon

Informations

If referenced objects (assemblies) are used in WPF, note the instructions in the Referenced objects (à la page 81) chapter.

6.2.1 Workflow with Microsoft Expression Blend

With Microsoft Expression Blend, a WPF element:

- ▶ is illustrated
- ▶ is converted into WPF format using **MS Expression Design**
- ▶ animated

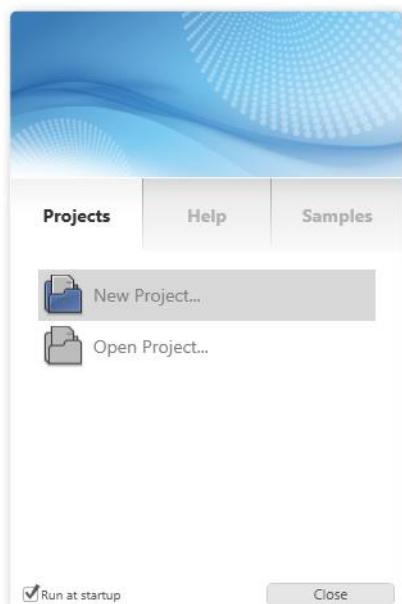

The following example shows the illustration and conversion of a button element into an XAML file.

Note: A test version of "Microsoft Expression Blend" can be downloaded from the Microsoft website.

Create button as an XAML file with Microsoft Expression Blend

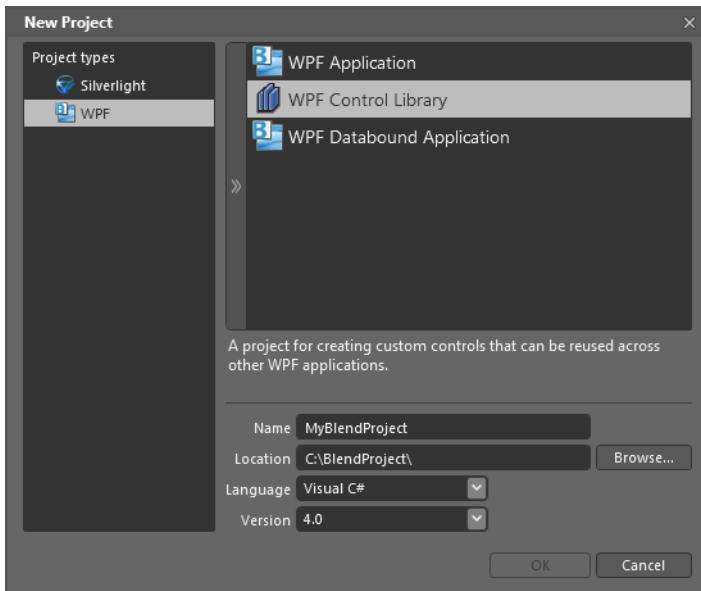

CREATE BUTTON

1. Start Expression Blend
2. select the **New Project** option

3. Select WPF as project type

4. give it a path and name of your choice (MyBlendProject, for example)

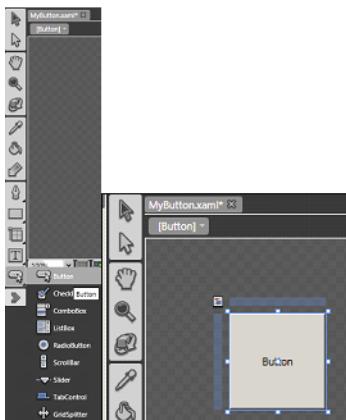

The **Language** and **Version** settings can be ignored, because no functionality is to be programmed.

5. After the dialog has been confirmed with **OK**, Microsoft Blend creates a new project with the chosen settings. Expression Blend adds an empty XAML file which already contains a class reference.
6. Delete the CS file that belongs to the XAML file using the context menu.
7. Rename the XAML file **MainControl.xaml** to **MyButton.xaml**.
8. The development size of the file is set at 640 x 480 pixels as standard and must still be changed:
 - a) switch to **XAML** view
 - b) correct the size to 100 x 100 pixels
 - c) Delete the class reference `x:Class="MyBlendProject.MyButton"`

```
MyButton.xaml ×
1 <UserControl
2   xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
3   xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
4   xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
5   xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
6   mc:Ignorable="d"
7   x:Name="UserControl"
8   d:DesignWidth="100" d:DesignHeight="100">
9
10  <Grid x:Name="LayoutRoot" />
11
12 </UserControl>
```

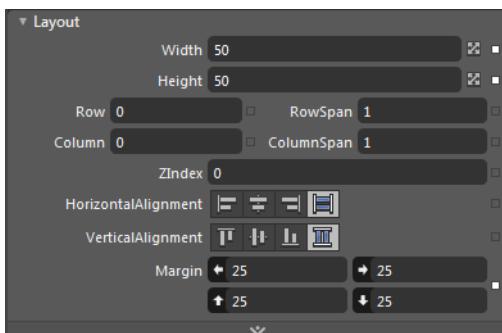

9. switch to **Design** view

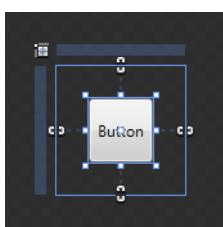

10. add a button via the toolbar

11. define the properties

- Width: 50
- Height: 50
- Margins: 25

The button is therefore at the center of the control.

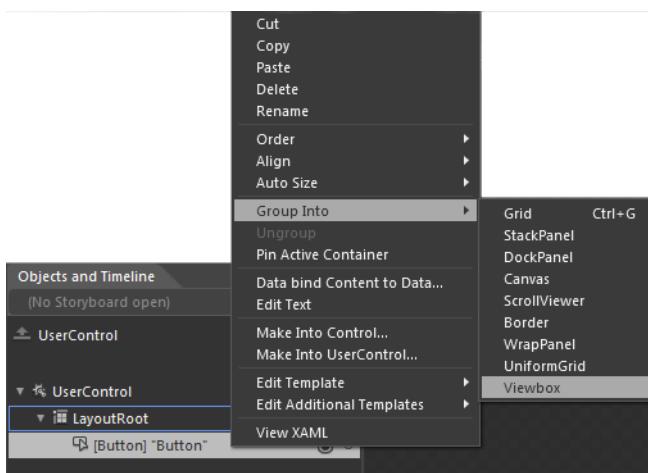

12. Save the changes and open the file in Internet Explorer to check it. You will see that the button is displayed in a size of 50 x 50 pixels.

MAKE BUTTON SCALABLE

If you integrate this status into zenon, the button will always have the exact size of 50 x 50 pixels. Because the button can be implemented as a scalable button, switch to Expression Blend again:

1. select the button in the tree view
2. select the Group Into->Viewbox button in the context menu
3. the button is inserted into a **Viewbox**
4. Define the properties of the viewbox
 - Width: Auto
 - Height: Auto
5. save the file

6. If you now open the file in Internet Explorer, the button is automatically scaled when the IE window size is changed. This file will now also automatically adapt to changes in the size of the **WPF element** in zenon.

CHANGE NAME

Before you can integrate the file into zenon, you must give the **WPF element** a name. The **WPF elements** are not named in Expression Blend as standard, and are labeled with square brackets and their type. zenon content is assigned to WPF content via the name of the **WPF elements**:

- ▶ in tree view, change the name
 - of the button on **MyButton**
 - of the ViewBox to **MyViewBox**

This button can now be integrated in zenon (à la page 170) as an XAML file.

6.2.2 Workflow with Adobe Illustrator

When **Adobe Illustrator** is used, a WPF element:

- ▶ is illustrated in **Adobe Illustrator**
- ▶ is converted into a WPF in **MS Expression Design**
- ▶ is animated in **MS Expression Blend**

The following example shows the illustration and conversion of a bar graph element into an XAML file.

Bar graph illustration

A bar graph is created in Adobe Illustrator.

1. AI: Starting element for bar graph

Illustrated in Adobe Illustrator CS3.

2. AI: Path view of bar graph in Adobe Illustrator

- All effects must be converted (**Object -> Convert appearance**)
- All lines are transformed into paths (**Object -> Path -> Contour line**)
- Do not use filters such as shading, blurring etc.

NOTES ON COMPATIBILITY

Illustrations that were created with Adobe Illustrator are in principle suitable for WPF export. However, not all Illustrator effects can become corresponding effects in Expression Design/Blend. Note:

Effect	Description
Clipping masks	<p>Clipping masks created in Adobe Illustrator are not correctly interpreted by Expression Design. These are usually shown in Blend as areas of black color.</p> <p>We recommend creating illustrations without clipping masks.</p>
Filters and effects	<p>Not all Adobe Illustrator filters are transferred into Expression Design accordingly: Thus blurring filters, shading filters and corner effects from Illustrator do not work in Expression Design.</p> <p>Solution:</p> <ul style="list-style-type: none"> ▶ Most effects can be converted so that they can be read correctly by Expression Design using the Object -> Convert appearance command in Adobe Illustrator. ▶ Corner effects from Adobe Illustrator are correctly interpreted by MS Design if they are converted to AI in paths.
Text fields	<p>To be able to link text fields with code, these must be created separately in Expression Blend. "Labels" are required for dynamic texts; simple "text fields" are sufficient for static information.</p> <p>There is no possibility to create text labels in MS Design. These must be directly created in MS Blend.</p>
Transparencies and group transparencies	<p>There can be difficulties in Adobe Illustrator with the correct interpretation of transparency settings, in particular from group transparency settings.</p> <p>However MS Expression Blend and MS Expression Design do offer the possibility to create new transparency settings.</p>
Multiply levels	<p>These level settings in Adobe Illustrator are not always correctly displayed by MS Expression Blend.</p> <p>However, there is the possibility to "Multiply levels" directly in Expression Design.</p>
Indicating instruments and standard positions	<p>To prepare the graphics optimally for animation, the indicator and slider must always be set to the starting position, usually 0 or 12:00 o'clock.</p> <p>Thus the position parameters for rotations etc. are also correct in Blend and an animation can be implemented without conversion of position data.</p>

WPF export

WPF files are required for animation in Microsoft Expression Blend. We recommend Microsoft Expression Design for this export, because it provides good results and most Illustrator effects are correctly interpreted.

Note: There is a free plug-in for the direct export of WPF files from Adobe Illustrator available on the internet. This plug-in provides a quick, uncomplicated way of exporting from Illustrator, however it is less suited to the current application because it lead to graphical losses. Even color deviations from the original document are possible.

Files in **.ai** format can regularly be imported into Expression Design; the paths are retained in the process.

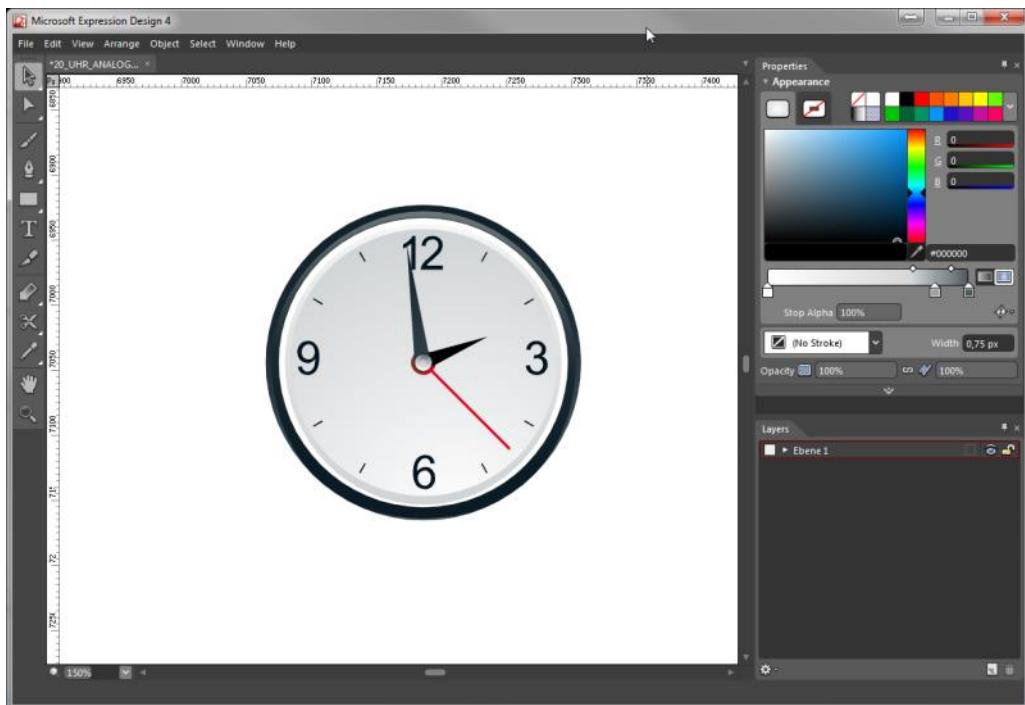

Attention: Some common Illustrator effects cannot be displayed by Expression Design correctly however (see Illustration (à la page 89) chapter).

We export the pre-created bar graph element in 5 stages:

1. **ED: Import**

- Import the prepared Illustrator file (à la page 89) in **Microsoft Expression Design** via File -> Import

2. **ED: Optimization**

- If the starting file is not correctly displayed in MS Expression Design, it can still be subsequently edited and optimized here

3. **ED: Select**

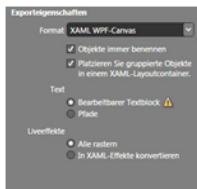

- Highlight the element for WPF export with the **direct selection** arrow in MS Expression Design; in this case it is the whole clock

4. ED: Start export

- Start the export via File -> Export
- the dialog for configuring the export settings opens

5. ED: Export settings

- Enter the following export settings:
 - Format:** XAML Silverlight 4 / WPF Canvas
 - Always name objects:** Activate with tick
 - Place the grouped object in an XAML layout container:** Activate with tick
 - Text:** Editable text block
 - Line effects:** Rasterize all

The exported file has **.xaml** file suffix. It is prepared and animated (à la page 92) in MS Expression Blend in the next stage.

Animation in Blend

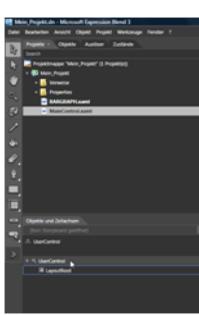

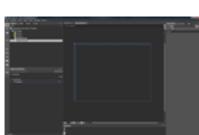

With MS Expression Blend:

- ▶ static XAML files from MS Expression Design are animated
- ▶ Variables for controlling effects that can be addressed by zenon are created

In thirteen steps, we go from a static XAML to an animated element, that can be embedded in zenon:

1. EB:create project

- a) Open Microsoft Expression Blend
 - b) Create a new project
 - c) Select the **Project type** of WPF- >WPF Control Library
 - d) Give it a name (in our tutorial: **My_Project**)
 - e) Select a location where it is to be saved
 - f) Select a language (in our tutorial: C#)
 - g) Select Framework Version 3.5
2. [EB: delete MainControl.xaml.cs](#)
- 
- a) Navigate to **MainControl.xaml.cs**
 - b) Delete this file using the **Delete** command in the context menu
3. [EB: Open exported XAML file](#)
- 
- a) Open the context menu for **My_Project** (right mouse button)
 - b) Select **Add existing element...**
 - c) Select the XAML file exported from Microsoft Expression Design, in order to open this in Microsoft Expression Blend
4. [EB: Open MainControl.xaml](#)
- 
- a) Open the automatically created **MainControl.xaml**
 - b) In the **Objects and Timeline** area, navigate to the **UserControl** entry
5. [EB: Adapt XAML code](#)
- 

- a) Click on **UserControl** with the right mouse button

- b) Select **Display XAML** in the contextual menu.

- c) Delete lines 7 and 9 in the XAML code:

```
x:Class="My_Project.MainControl"  
d:DesignWidth="640" d:DesignHeight="480"
```

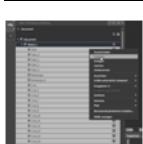

6. EB: check XAML code

- The XAML code should now look like this:

```
<UserControl  
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation  
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml  
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008  
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"  
  
    mc:Ignorable="d"  
    x:Name="UserControl">  
  
    <Grid x:Name="LayoutRoot"/>  
</UserControl>
```

7. EB: Copy elements

- a) Open the XAML file imported from Expression Design
- b) Mark all elements
- c) Select **Delete** in the context menu
- d) Change back to the automatically created XAML file

8. EB: Insert element

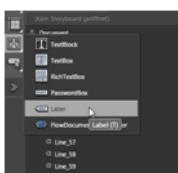

- a) Click on **Layout Root** with the right mouse button
- b) Select **Insert**

9. EB: Adapt layout type

- a) Click on Layout root -> Change layout type -> Viewbox with the right mouse button
- b) The structure should now look like this: **UserControl** -> **LayoutRoot** -> **Grid** -> **Elements**
- c) Give a name for **LayoutRoot** and **Grid** by double-clicking on the names

10. EB: Texts and values

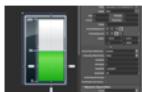

- Dynamic and static texts are labeled with text fields
- Values (numbers) are issued with **Labels**

11. EB: Insert labels

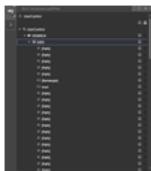

- Labels replace numbers that are to be subsequently linked using INT variables (must be carried out for all number elements)

12. EB: Set property

- To display 100%, set the bar graph element's **MaxHeight** property to 341 (the maximum height of the indicator element is 340)

13. EB: prepare for use in zenon

- a) Delete all name labels (names may only be given for elements that are to be addressed via zenon)

- b) Save the XAML file with any desired name
- c) Integrate the XAML file into zenon (à la page 164)

A tip for checking: If the XAML file is displayed with no problems in Microsoft Internet Explorer and the window size of Internet Explorer adapts to it, it will also be correctly used in zenon.

6.3 Guidelines for developers

This section handles the creation of simple WPF user controls with code-behind functionality using Microsoft Visual Studio and debugging this user control in Runtime.

The following tools were used for this:

- ▶ Microsoft Visual Studio 2015
- ▶ zenon

Informations

A Microsoft Visual Studio version from 2012 is recommended, due to the better-integrated XAML designer.

6.3.1 Creation of a simple WPF user control with code behind function

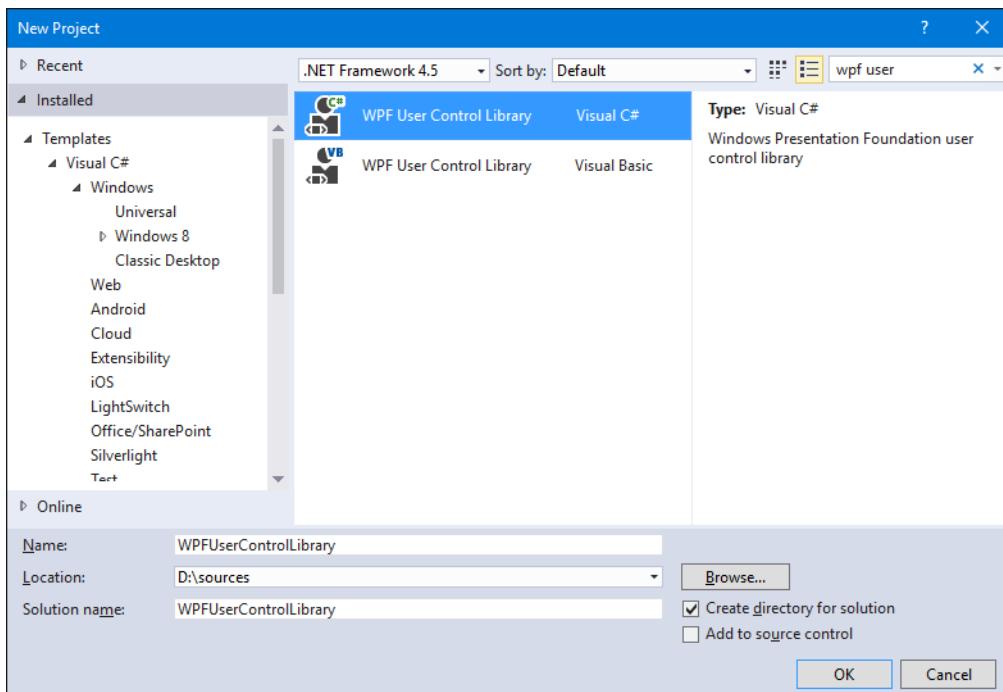

The creation and incorporation of a simple user control is described in this chapter. Because only the fundamental mechanisms/process for integration into zenon is described, the functionality of the user control is limited to the addition of two values. There is intentionally no enhanced error handling or explicit completion, in order to retain the simplicity of this example.

CREATE WPF USER CONTROL

1. Create a new **Solution** and a **WPF User Control Library** in this in Visual Studio.

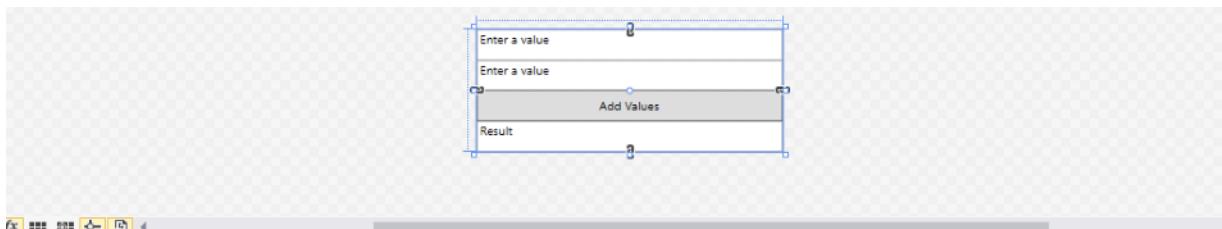

The .NET framework version 4 was selected for this example. A different version can also be selected, which must be installed on the target system on which Runtime will subsequently be started.

Info: If the corresponding project template does not appear in the list of available templates, this can be added by means of the search (field at the top right of the dialog).

In our example, the project is given the name **WPFUserControlLibrary**.

2. Create 3 text boxes and a button in the `UserControl1.xaml` file:

```

<UserControl x:Class="WPFUserControlLibrary.UserControl1"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:local="clr-namespace:WPFUserControlLibrary"
    mc:Ignorable="d"
    d:DesignHeight="120" d:DesignWidth="300">
    <Grid Height="120" Width="Auto">
        <StackPanel>
            <TextBox x:Name="textBoxA" Height="30" TextWrapping="Wrap" Text="Enter a value" HorizontalAlignment="Stretch"/>
            <TextBox x:Name="textBoxB" Height="30" TextWrapping="Wrap" Text="Enter a value" HorizontalAlignment="Stretch"/>
            <Button x:Name="buttonAdd" Height="30" Content="Add Values" HorizontalAlignment="Stretch" VerticalAlignment="Top" Click="buttonAdd_Click"/>
            <TextBox x:Name="textBoxC" Height="30" TextWrapping="Wrap" Text="Result" HorizontalAlignment="Stretch" IsReadOnly="True"/>
        </StackPanel>
    </Grid>
</UserControl>

```

3. Add the following code in the click event of the button:

```

private void buttonAdd_Click(object sender, RoutedEventArgs e)
{
    try
    {
        textBoxC.Text = (Convert.ToInt32(textBoxA.Text) + Convert.ToInt32(textBoxB.Text)).ToString();
    }
    catch (Exception ex)
    {
        textBoxC.Text = "Error adding values: " + ex.Message;
    }
}

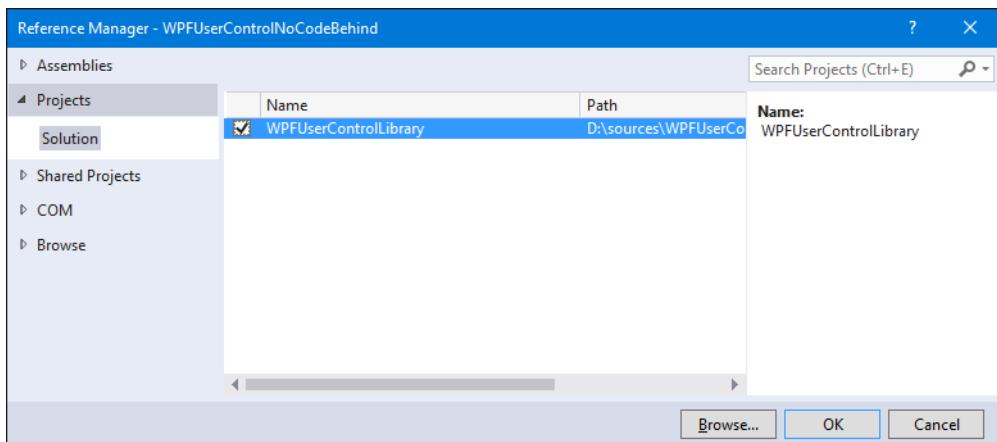

```

Now you have the user control with the required functionality available. However, because zenon can only display XAML files that do not link to a code-behind file, an additional XAML file is needed that references the library (assembly) that has just been built.

CREATION OF THE XAML FILE (WITHOUT CODE BEHIND) FOR ZENON

Proceed as follows to create the XAML file required in zenon.

1. Create a further project, again as a **WPF User Control Library**
2. It was called **WPFUserControlNoCodeBehind** in our example.
3. Insert a reference to the project that has just been built into this new project.

4. The XAML files (**UserControl1.xaml**) looks as follows:

```
<UserControl x:Class="WPFUserControlNoCodeBehind.UserControl1"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:local="clr-namespace:WPFUserControlNoCodeBehind"
    mc:Ignorable="d"
    d:DesignHeight="300" d:DesignWidth="300">
    <Grid>
        </Grid>
</UserControl>
```

5. Because all necessary content is contained in the DLL that has been created and no code-behind file can be used, delete the following lines:

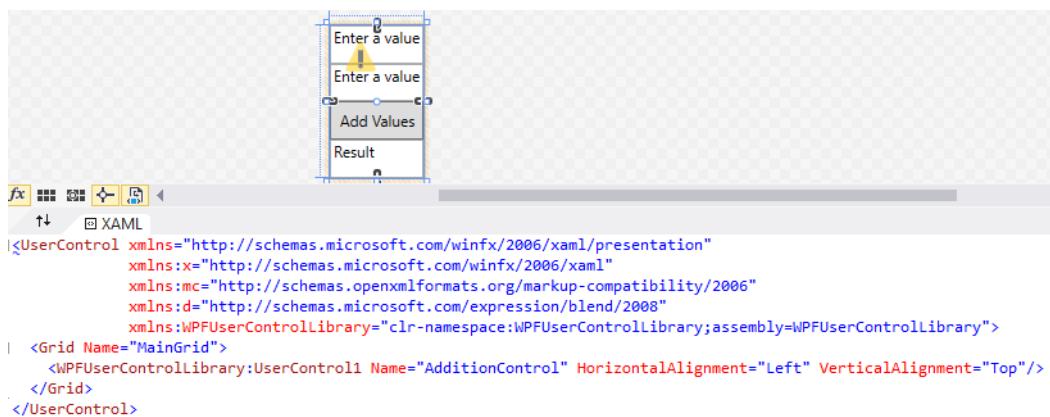

```
x:Class="WPFUserControlNoCodeBehind.UserControl1"
      xmlns:local="clr-namespace:WPFUserControlNoCodeBehind"
```
6. Also delete (for the designer's size setting) the following lines:

```
mc:Ignorable="d"
      d:DesignHeight="300" d:DesignWidth="300"
```
7. Delete the code-behind file (**UserControl1.xaml.cs**) in this project.

8. Drag the user control that has been created beforehand (for the project **WPFUserControlLibrary**) over the toolbox in the XAML designer.
9. Assign a name for the grid and the user control.

Attention: If no name is given here, these elements do not appear in the linking dialog in the zenon Editor and thus cannot be made dynamic.

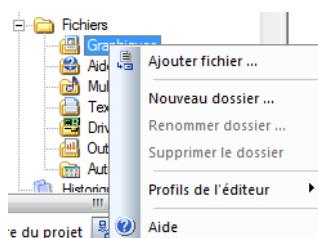

10. The XAML file should now look as follows:

In the next step, how the DLL and XAML file are incorporated into zenon is explained.

STEPS IN ZENON

1. Open the zenon Editor
2. Go to File -> Graphics.
3. Select **Add file...** in the context menu

4. Select the XAML file at the save location (**UserControl1.xaml** from the **WPFUserControlNoCodeBehind** project) and add this:

Status	File name	Type	Size	Preview
	UserControl1.xaml	xaml	0 KB	

5. Insert the DLL with the functionality for the XAML file.

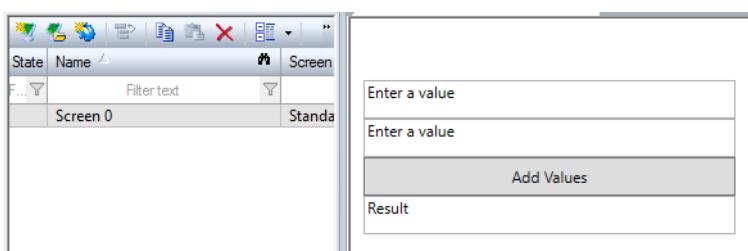

To do this:

- a) Select, in the context menu, File -> Other **Add file....**
- b) Select the file **WPFLUserControlLibrary.dll** (from the output path) of the first project (**WPFLUserControlLibrary**).

State	File name	Type	Size
F...	Filter text	Filter...	Filter...
	WPFLUserControlLibrary.dll	dll	9 KB

6. Create a zenon screen.
7. Add a WPF element and select the previously-incorporated XAML file.

You should now see the following in the zenon Editor:

8. Start zenon Runtime in order to also test the control there.

10
20
30
Add Values

Informations

The XAML file and referenced assemblies can also be saved in complied form as a *.cdwpf file. Only one file thus need to be imported in the Editor (under **Files -> Graphics**). Further information on this can be found in the CDWPF files (collective files) (à la page 119) chapter.

Hint: When developing a WPF user control, it is usually more practical to insert the XAML file and the referenced DLL(s) separately. This makes the replacement of the DLL and debugging easier. Further information on the topic of debugging in the Debugging the WPF user control in Runtime (à la page 101).

Attention

Assemblies are only removed after loading when the application is ended. This means:

If a WPF file with a referenced assembly in zenon is displayed, then this assembly is loaded in the memory until zenon is ended, even if the screen is closed again. If you would like to remove an assembly from the Files/Other folder, the Editor must first be restarted, so that the assembly is removed.

Further examples can be found in the Examples: Integration of WPF into zenon (à la page 164) chapter.

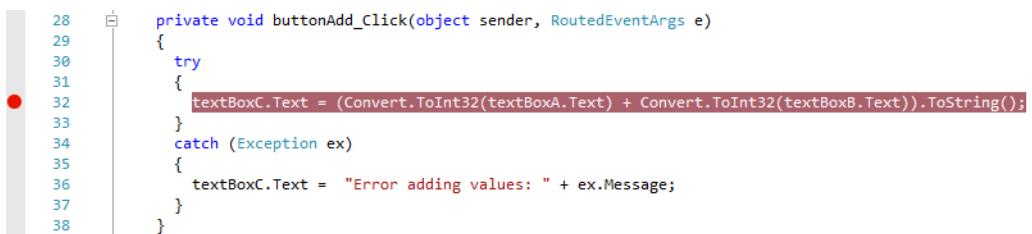

6.3.2 Debugging the WPF user control in Runtime

To debug the WPF user control in Runtime, proceed as follows.

In this example, the control described in the Creation of a simple WPF user controls with code behind function (à la page 96) is used.

DEBUGGING BY MEANS OF ATTACH TO PROCESS

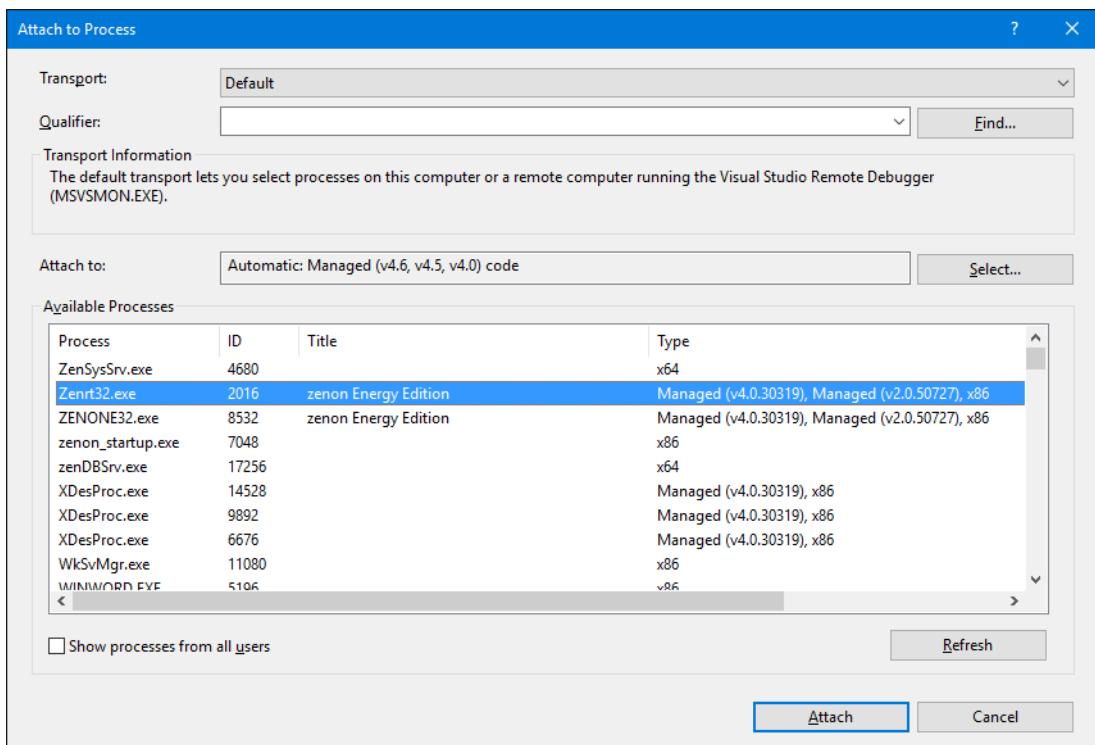

1. Ensure that zenon Runtime has been started and a screen with the WPF user control is open.
Furthermore, ensure that the DLL that is currently being used corresponds to the build (Version) of the user control project (**WPFLUserControlLibrary**).
2. Set a breakpoint in the click event of the button in the Visual Studio project

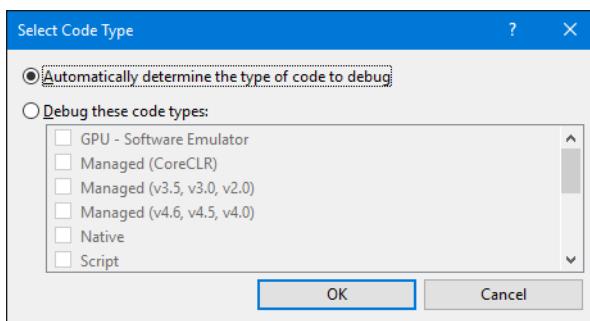

```
28     private void buttonAdd_Click(object sender, RoutedEventArgs e)
29     {
30         try
31         {
32             textBoxC.Text = (Convert.ToInt32(textBoxA.Text) + Convert.ToInt32(textBoxB.Text)).ToString();
33         }
34         catch (Exception ex)
35         {
36             textBoxC.Text = "Error adding values: " + ex.Message;
37         }
38     }
```

3. In Visual Studio, under **Debug**, select the **Attach to Process** menu item.

4. Select the zenon Runtime process

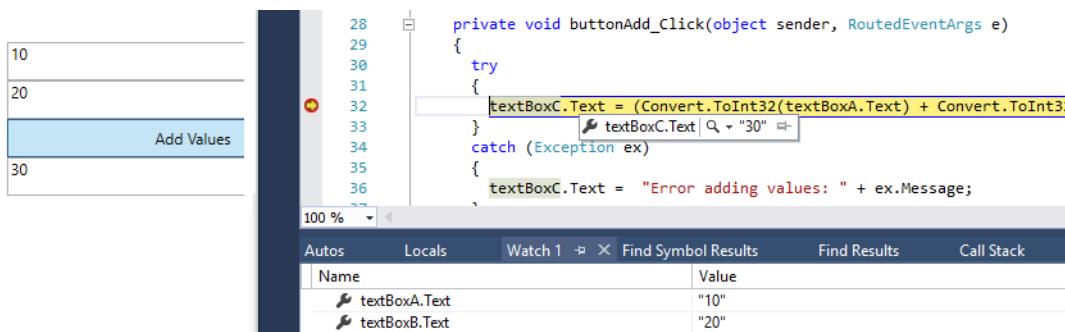

5. Under **Attach to**, select either **Automatic** or the corresponding .NET framework version (**v4.x** in this case)

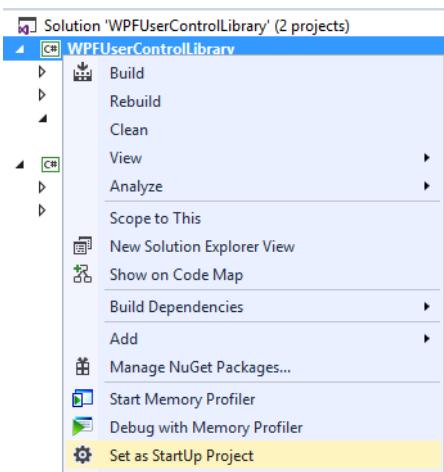

6. Click on **Attach**.

- Now trigger the breakpoint in which you enter values into the WPF control in zenon Runtime and click on the button

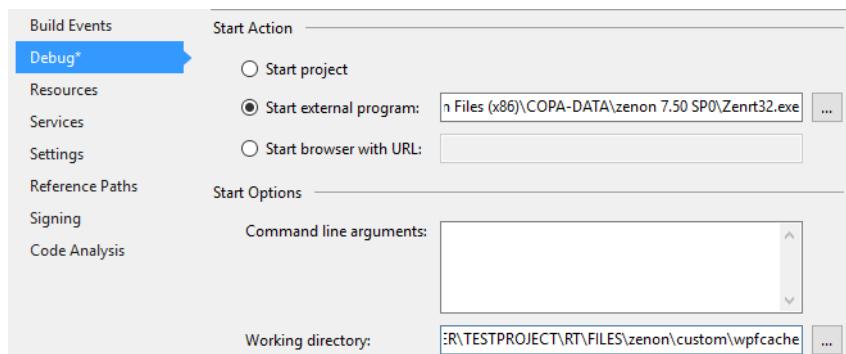

DEBUG USING START EXTERNAL PROGRAM

- Ensure that zenon Runtime has been closed.
- Ensure that, in the zenon Editor, the project that contains the WPF user control has been set as the start project.
- Ensure that the user control project (**WPFUserControlLibrary**) is set as the start project in Visual Studio.

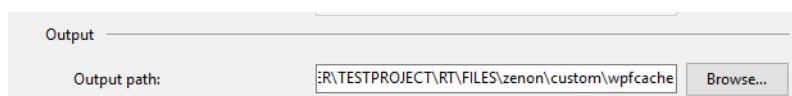

- In the project properties of the Visual Studio project, select under **Debug**, for **Start action: Start external program**
- For **Start external program**, select the path of the zenon Runtime application.
- Under Working Directory, select the **\wpfcache** folder of the Runtime files
(...\\PROJECTNAME\\RT\\FILES\\zenon\\custom\\wpfcache)

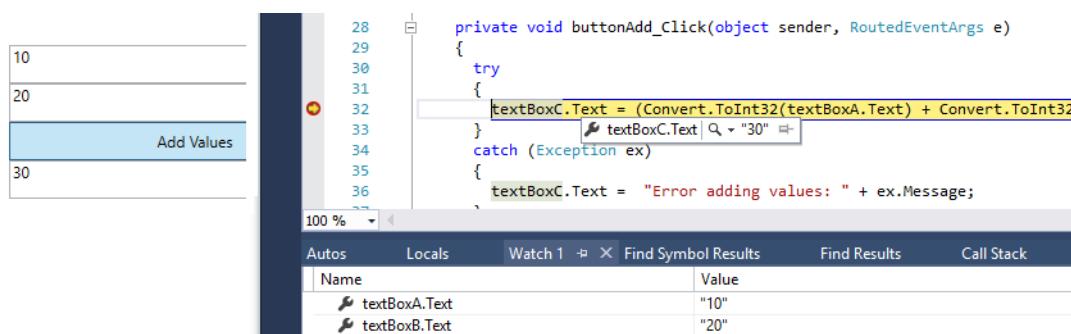

Hint: In the selected project in the zenon Editor, press the keyboard combination **CTRL+ALT+R** in order to jump directly to the root directory of the Runtime files.

7. In the project properties, enter \wpfcache folder of the Runtime files as the output path under Build

8. Create the project in Visual Studio
 9. Start debugging in Visual Studio with **Start**
- 
10. zenon Runtime is now started automatically.
 11. Trigger the breakpoint by entering values in the WPF control in zenon Runtime and click on the button

Informations

When starting zenon Runtime, the assemblies (DLLs) referenced in the WPF user controls from the **\FILES\zenon\custom\additional** folder, and/or the assemblies from **CDWPF** files in the **\FILES\zenon\custom\wpfcache** folder are copied. If the file version of the DLL in the **\wpfcache** folder is one higher than the version of the "original file", it is not replaced!

For debugging, it is thus sufficient to only replace the file that is on the **\wpfcache** folder directly.

For delivery, it must be ensured that the current version of the DLL is present in the **\additional** folder or the **CDWPF** file!

Attention: If only the DLL is updated in the **\additional** folder or in the **CDWPF**, but the version number is not increased, the DLL must be deleted manually in the **\wpfcache** folder, because it is not updated otherwise (due to the above-described mechanism).

Attention

Assemblies are only removed after loading when the application is ended. This means:

If a WPF file with a referenced assembly in zenon is displayed, then this assembly is loaded in the memory until zenon is ended, even if the screen is closed again. If you would like to remove an assembly from the Files/Other folder, the Editor must first be restarted, so that the assembly is removed.

6.3.3 Data exchange between zenon and WPF user controls

There are different possibilities for exchanging data between zenon and WPF user controls.

- ▶ Data exchange using dependency properties (à la page 105)
- ▶ Data replacement via VSTA (à la page 109)

Data exchange using dependency properties

The most elegant and secure way to exchange data between zenon and self-created WPF user controls is by using dependency properties.

The WPF user control project created in the Creating a simple WPF user controls with code behind function (à la page 96) serves as a basis (**WPFTUserControlLibrary**).

In this chapter too, the focus is purely on the core theme (dependency properties and data exchange between the user control and zenon in this case). Specific WPF features such as data connection, etc., as well as explicit error handling, are not covered.

ADDITIONS TO THE CODE

1. Create the `TextChanged` Event for the `textBoxA` element in the **UserControl1.xaml** file

```
TextChanged="textBoxA_TextChanged"
```

2. Add the following lines of code in the `UserControl1` class of the code behind file (**UserControl1.xaml.cs**)

```
/// <summary>
/// Gets or sets the ValueA.
/// </summary>
public double ValueA
{
    get
    {
        return (double)GetValue(ValueADependencyProperty);
    }
    set
    {
        SetValue(ValueADependencyProperty, value);
    }
}

/// <summary>
/// Dependency property for ValueA
/// </summary>
public static readonly DependencyProperty ValueADependencyProperty =
DependencyProperty.Register("ValueA", typeof(double),
typeof(UserControl1), new FrameworkPropertyMetadata(0.0, new
PropertyChangedCallback(OnValueADependencyPropertyChanged)));

/// <summary>
/// Called when [value a dependency property changed].
/// </summary>
/// <param name="source">The source.</param>
```

```
/// <param name="e">The <see cref="DependencyPropertyChangedEventArgs"/> instance  
containing the event data.</param>  
  
private static void OnValueADependencyPropertyChanged(DependencyObject source,  
DependencyPropertyChangedEventArgs e)  
{  
    UserControl1 control = source as UserControl1;  
    if (control != null)  
    {  
        try  
        {  
            control.ValueA = (double)e.NewValue;  
            control.textBoxA.Text = control.ValueA.ToString();  
        }  
        catch (Exception)  
        {}  
    }  
}  
  
/// <summary>  
/// Handles the TextChanged event of the textBoxA control.  
/// </summary>  
/// <param name="sender">The source of the event.</param>  
/// <param name="e">The <see cref="TextChangedEventArgs"/> instance containing the  
event data.</param>  
  
private void textBoxA_TextChanged(object sender, TextChangedEventArgs e)  
{  
    try  
    {  
        ValueA = Convert.ToDouble(textBoxA.Text);  
    }  
    catch (Exception)  
    {}  
}
```

Then build the solution.

Informations

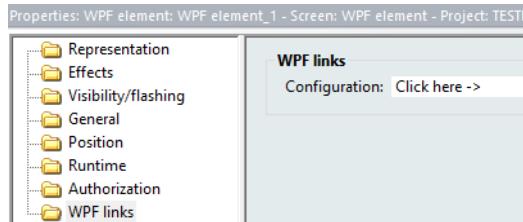

A numerical property (`double`) is used in this example. Other simple data types (such as `bool`, `string`, `int`, etc.) can also be used.

LINKING IN ZENON

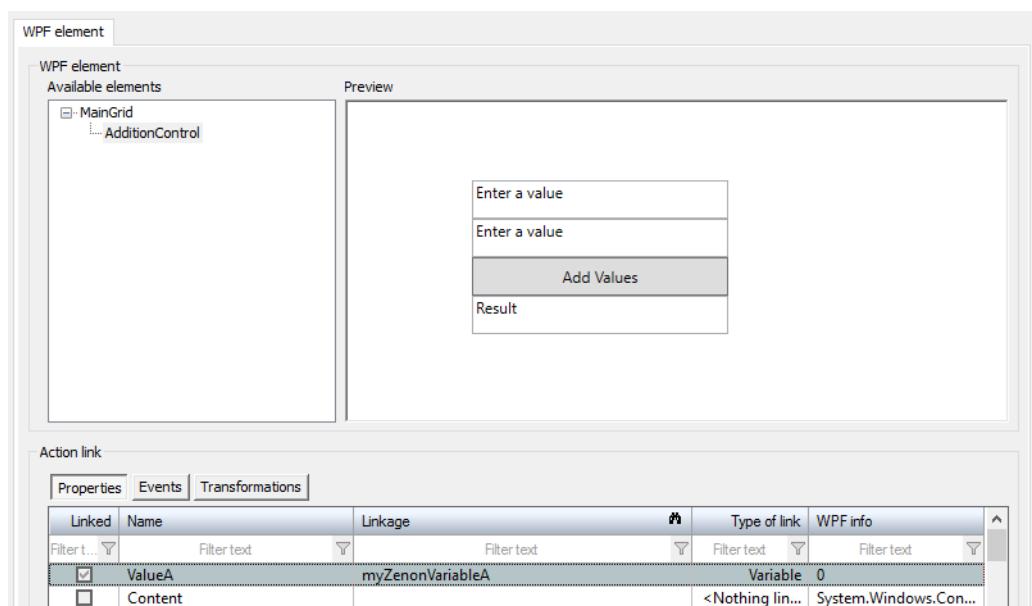

1. Update the WPF user control (DLL) in the zenon Editor.

To do this, proceed as described in the Creating a simple WPF user controls with code behind function (à la page 96) and note that, under certain circumstances, the zenon Editor must be restarted if another version of the assembly (DLL) has been loaded by the Editor.

2. Create a numeric variable in zenon and link it to a dynamic text element in the screen next to the WPF element with your user control.
3. Open the screen that contains the WPF element and select, for the WPF element, under **WPF links: Configuration**

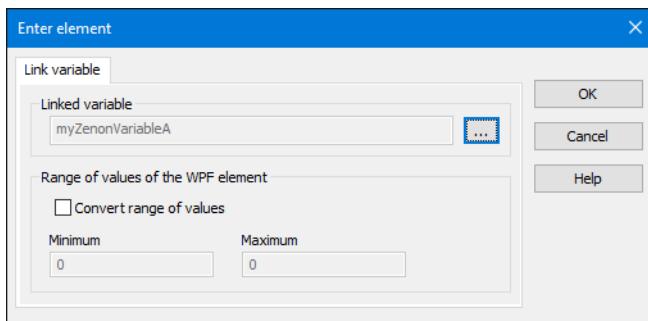

4. Expand the node in the tree at the top left and select **AdditionControl**

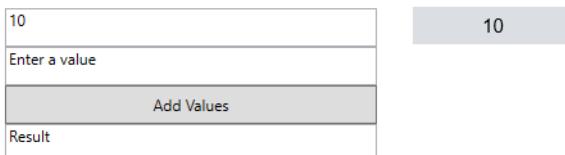

5. Select the line with `ValueA` (this is the name of the property that was created in the code beforehand) and select, for **Type of link:** **Variable**.

Hint: Give Properties a prefix so that this can be found more easily, for example: _ValueA

6. In the column under **Linkage**, print out the variable that was created in zenon beforehand

7. Confirm the dialog with OK and build the Runtime files
8. Start Runtime in order to test the WPF user control

9. If the value is changed in user control, the value automatically changes in zenon and vice versa.
10. Of course you can debug the control as described in the Debugging the WPF user control in Runtime (à la page 101) chapter, as well as create further dependency properties.

Informations

The `UserControl_Loaded` event can be used in order to (automatically) access the values of the dependency property during initialization (when calling up the user control) for example.

Data replacement via VSTA

Data can also be exchanged between zenon and WPF user controls using VSTA.

The API element methods

- ▶ `get_WPFProperty` (reading of values)
- ▶ `set_WPFProperty` (writing of values)

are used for this.

The example used here is based on the example used in the Data exchange using dependency properties (à la page 105) chapter.

CREATION OF A VSTA MACRO FOR DATA EXCHANGE BETWEEN ZENON AND THE WPF USER CONTROL

1. Create the following VSTA macro in the project add-in of the zenon project

```

/// <summary>
/// Sample Macro for data exchange between VSTA and a WPF User Control
/// </summary>
public void MacroWPFAccess()
{
    //Get the Screen and Element hosting the WPF User Control
    zenOn.IDynPicture myWPFScreen = this.DynPictures().Item("Screen");
    zenOn.IElement myWPFElement = myWPFScreen.Elements().Item("WPF_Element");

    //Read the current value from the WPF Element property
    double currentValue = Convert.ToDouble(myWPFElement.get_WPFPProperty("AdditionControl", "ValueA"));

    //Double the value and write it back to the WPF Element property
    myWPFElement.set_WPFPProperty("AdditionControl", "ValueA", currentValue * 2);
}

```

Whereby:

- "Screen" is the name of the zenon screen in which the WPF element is located
 - "WPF_Element" is the name of the WPF element that contains the WPF user control
 - "AdditionControl" is the name of the WPF user controls itself (defined in the **(UserControl1.xaml** file)
 - "ValueA" is the name of the user control property
2. Create an execute VSTA macro function and link this to a button in the screen in which the WPF element is also located
 3. Start Runtime to test changes

When executing the macro, the value is read by the control, doubled and written back.

Informations

The user control properties used for this method of data exchange need not necessarily be dependency properties, as outlined in this example. "Standard" properties can also be used, see in relation to this the Access via VSTA "variable link" (à la page 111) chapter.

6.3.4 Access to the zenon (Runtime) object model from a WPF user control

There are different possibilities for access to the zenon object model from a WPF user control. This is explained in more detail in the following chapters.

Access via VSTA "variable link"

In order to get access to the zenon Runtime COM interface by means of "variable link", proceed as follows. The creation of a simple WPF user controls with code behind function (à la page 96) serves as an initial example.

 **Informations**

The following code is intended to show an example of how the COM implements access to zenon Runtime and in doing so limits itself to the basic functionality. There is no explicit error handling, etc.

NECESSARY AMENDMENTS IN WPF USER CONTROL

The following steps are necessary in the WPF user control project (**WPFUserControlLibrary**).

Firstly, a reference to the zenon COM interface must be incorporated.

After this, the following code must be inserted in the **UserControl1** class:

```
//The zenon Project
zenOn.Project zenonProject = null;
```

```
/// <summary>
/// Property for the Variable link via VSTA
/// </summary>
public object zenonVariableLink
{
    get { return null; }
    set
    {
        if (value != null && zenonProject == null)
        {
            zenOn.Variable zenonVariable;
            try
            {
                zenonVariable = (zenOn.Variable)value;
            }
            catch (Exception)
            {
                return;
            }
            if ((zenonVariable!= null) && (!string.IsNullOrEmpty(zenonVariable.Name)))
            {
                zenonProject = zenonVariable.Parent.Parent;
            }
        }
    }
}

/// <summary>
/// Trigger used to notify the control from VSTA to release the COM resources
/// </summary>
public object zenonReleaseTrigger
{
    get { return null; }
    set
    {
        if ((bool)value && zenonProject != null)
        {
            try
            {
```

```
        Marshal.FinalReleaseComObject(zenonProject);

    }

    catch (Exception)

    {

        return;

    }

    zenonProject = null;  
GC.Collect();  
GC.WaitForPendingFinalizers();  
GC.Collect();  
}  
}  
}
```

Whereby access to the properties `zenonVariableLink` (to initialize the COM object) and `zenonReleaseTrigger` (to unlock the COM object) are subsequently accessed from VSTA (write).

In order to test the COM access quickly very easily, it is possible to insert the following line of code in the existing button-click event of the user control.

```
private void buttonAdd_Click(object sender, RoutedEventArgs e)
{
    if (zenonProject != null)
    {
        MessageBox.Show(zenonProject.Name);
    }
    return;
}
```

1

Informations

A `zenOn.Project` variable is used in this example. Of course other objects such as events, etc. of the zenon object model can also be used.

NECESSARY AMENDMENTS IN THE ZENON PROJECT/VSTA CODE

The following steps are necessary in the VSTA code:

Creation of a VSTA macro for the initialization

/// <summary>

```

/// Macro for API initialization in the WPF User Control
/// </summary>
public void MacroWPFIInit()
{
    zenOn.IDynPicture myWPFScreen = this.DynPictures().Item("Screen");
    zenOn.IElement myWPFElement = myWPFScreen.Elements().Item("WPF_Element");
    myWPFElement.set_WPFProperty("AdditionControl", "zenonVariableLink",
this.Variables().Item(0));
}

```

Creation of a VSTA macro for approval

```

/// <summary>
/// Macro for API release in the WPF User Control
/// </summary>
public void MacroWPFRRelease()
{
    zenOn.IDynPicture myWPFScreen = this.DynPictures().Item("Screen");
    zenOn.IElement myWPFElement = myWPFScreen.Elements().Item("WPF_Element");
    myWPFElement.set_WPFProperty("AdditionControl", "zenonReleaseTrigger", true);
}

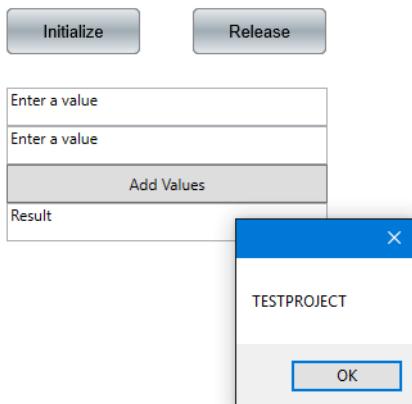

```

Create two execute VSTA macro functions that are linked with buttons, which are in the same screen as the WPF element.

Now start Runtime in order to test the functionality

- ▶ Execute the macro for initialization

- ▶ Click on the button in the WPF user control; a message box with the project name of the project appears

- ▶ Execute the macro for release

In order to debug the user control, it is possible to proceed as described in the Debugging the WPF user control in Runtime (à la page 101).

Conseil

The initialization and release of the COM object in this example is only carried out for simple demonstration using VSTA macro functions. Depending on the application, and/or in practice, events in VSTA are better suited to this.

For example, the code for initialization in the `_Open` event of the screen can be executed with the WPF element and the code for release in the `_Close` event.

The mechanism described here is also used in the Display of WPF elements in the zenon Web Client (à la page 160) chapter.

Attention

If COM objects are used in WPF user controls, these must always be explicitly approved before destroying the WPF user control (before closing the screen, before closing Runtime, before reloading).

Access via marshaling

In order to get access to the zenon Runtime COM interface by means of marshaling, proceed as follows. The creation of a simple WPF user controls with code behind function (à la page 96) serves as an initial example.

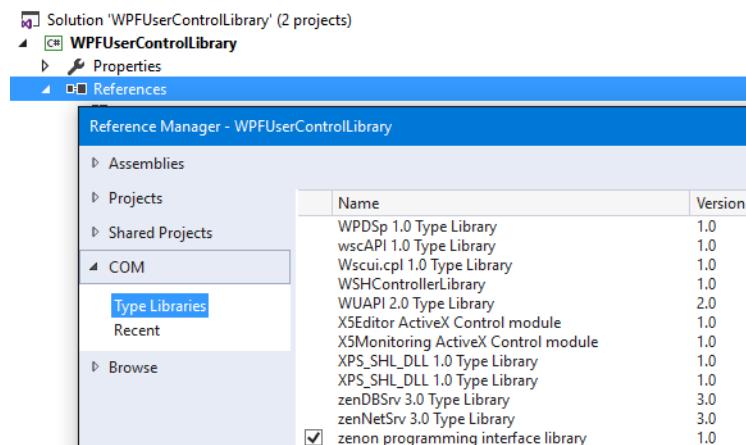

Informations

The following code is intended to show an example of how the COM implements access to zenon Runtime and in doing so limits itself to the basic functionality. There is no explicit error handling, etc.

NECESSARY AMENDMENTS IN WPF USER CONTROL

The following steps are necessary in the WPF user control project (**WPFUserControlLibrary**).

Firstly, a reference to the zenon COM interface must be incorporated.

After this, the following code must be inserted in the **UserControl1** class:

```
//The zenon Project
zenOn.Project zenonProject = null;
```

Furthermore, the constructor of the user controls must be supplemented with the lines below (to initialize the COM object):

```
/// <summary>
/// Constructor for UserControl1, initialize COM Object
/// </summary>
public UserControl1()
{
    InitializeComponent();

    try
    {

```

```

zenonProject =
((zenOn.Application)Marshal.GetActiveObject("zenOn.Application")).Projects().Item("TES
TPROJECT");
}
catch (Exception)
{
}
}

```

The COM object must be approved in the `UserControl_Unloaded` event:

```

/// <summary>
/// Release COM Object
/// </summary>
private void UserControl_Unloaded(object sender, RoutedEventArgs e)
{
    try
    {
        if (zenonProject != null)
        {
            Marshal.FinalReleaseComObject(zenonProject);
            zenonProject = null;
        }
    }
    catch (Exception)
    {
    }
}

```

In order to test the COM access quickly very easily, it is possible to insert the following line of code in the existing button click event of the user control.

```

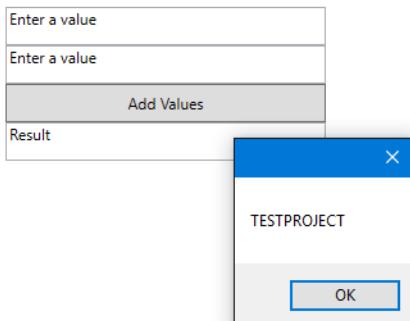

private void buttonAdd_Click(object sender, RoutedEventArgs e)
{
    if (zenonProject != null)
    {
        MessageBox.Show(zenonProject.Name);
    }
    return;
}

```

...

Now build the solution and update the WPF user control in the zenon project.

Start Runtime to test the user control.

In order to debug the user control, it is possible to proceed as described in the Debugging the WPF user control in Runtime (à la page 101).

Informations

A `zenOn.Project` variable is used in this example. Of course other objects such as events, etc. of the zenon object model can also be used.

Attention

If COM objects are used in WPF user controls, these must always be explicitly approved before destroying the WPF user control (before closing the screen, before closing Runtime, before reloading).

Informations

No access by means of marshaling is possible in the zenon web client. If access to the COM interface is required there, the method described in the Access via VSTA "variable link" (à la page 111) must be used.

6.4 Engineering in zenon

In order to be able to use WPF user controls in zenon, version 3.5 (or higher, depending on the .NET framework version used in the user control) of the Microsoft framework must be used on both the Editor computer and the Runtime computer.

CONDITIONS FOR THE WPF DISPLAY IN ZENON

The dynamization is currently available for simple variable types (numerical data types as well as string). Arrays and structures cannot be dynamized.

Therefore the following WPF functions can be implemented in zenon:

- ▶ Element properties that correspond to simple data types, such as `SString`, `Int`, `Double`, `Bool` etc.
- ▶ Element properties of the "Object" type, which can be set with simple data types
- ▶ Element events can be used with functions; the parameters of the events are not however available in and cannot be evaluated in zenon
- ▶ Element transformation, for which a **RenderTransform** is present for the element in the XAML file

Attention: if the content is outside of the area of the WPF element during transformation, this is not labeled

Notes on dBase: No shade can be displayed in zenon for WPF elements.

Attention

*If the Runtime files were created for a project for a version before 6.50, existing **WPF** elements are not included into Runtime screens.*

6.4.1 CDWPF files (collective files)

A CDWPF file (with the suffix ***.cdwpf**) is an renamed ZIP file that contains the following components:

- ▶ XAML file (to reference the user control assembly)
- ▶ DLL file (the actual WPF user control, optional)
- ▶ Preview graphics (for preview, optional)

Rules for the use of collective files:

- ▶ The files (XAML, DLL, preview graphics) can be in the CDWPF file directly or in a joint folder.
- ▶ The name of the collective file should correspond to the names of the XAML file.
- ▶ Only one XAML file may be contained.
- ▶ The preview graphic should be small and no more than 64 pixels high.
Name of the preview file: **preview.png** or the name of the XAML file with the suffix **.png**.
- ▶ Any number of assemblies can be used. The distinction is made on the basis of the file version.
- ▶ Collective files do not need to contain an assembly.
- ▶ All subfolders are examined and only taken into account with ***.dll**, ***.xaml** or ***.png** files.
- ▶ If a collective file (***.cdwpf**) is replaced by a file with a different version, all corresponding CDWPF files in all symbols and images in all projects must be adapted.

6.4.2 create WPF element

To create a WPF element

1. In the elements toolbar, select the symbol for **WPF element** or the **Elements** entry in the menu
2. Select the start point in the main window.
3. Pull open the element with the mouse.
4. In properties, select **Affichage** the property **Fichier XAML** in the group.
5. The file selection dialog opens.
6. Select the desired file
Files of the following formats are valid:
 - *.xaml: Extensible Application Markup Language
 - *.cdwpf: WPF collective file, also shows preview image
 (The file must already be present in the Project Manager under **Files/graphics** or created in the dialog.)
7. Configure the links (à la page 121).

Informations

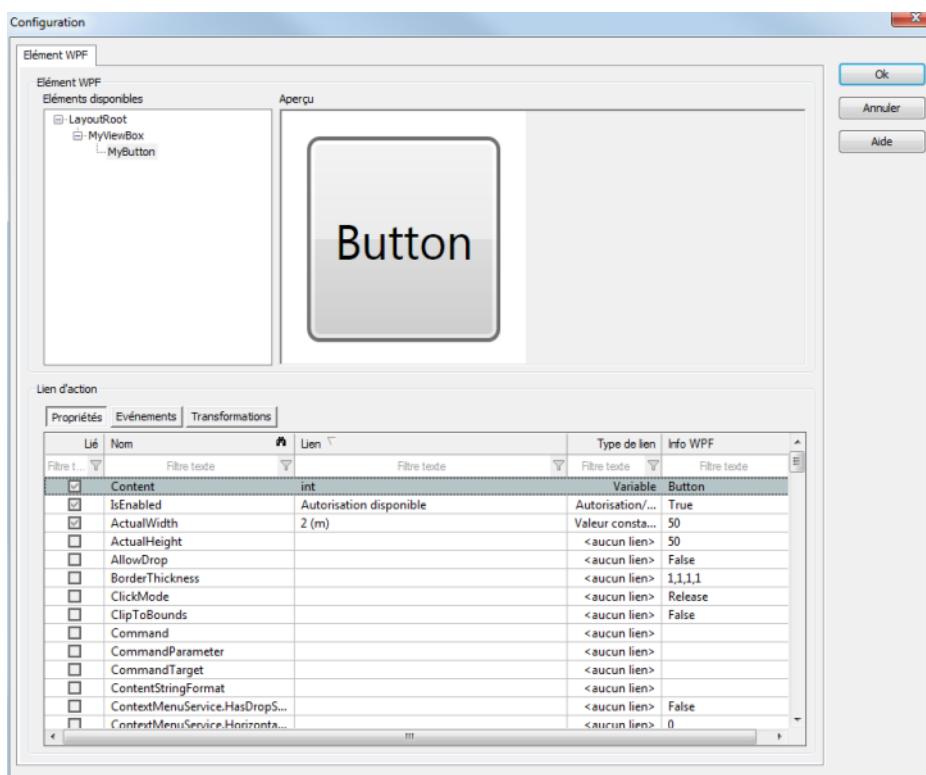

If referenced assemblies are used, note the instructions in the Referenced assemblies (à la page 81) chapter.

6.4.3 Configuration of the linking

To configure a WPF element

1. In properties, select **Liens WPF** the property **Configuration** in the group.
2. The dialog with three tabs opens with a preview of the XAML file and the elements present in the file

DIALOG CONFIGURATION

Parameters	Description
Available elements	Shows the named file elements in a tree structure. The selected element can be linked with process data.
	WPF is assigned to process data based on the element name. Therefore elements are only shown if they and the attendant elements have a name. Allocations are configured and shown in the Properties, Events, Transformations tabs. Hint: If the corresponding elements are not displayed, check in the XAML file to see if this has a name (for example: <Grid Name="GridName">).
Preview	The selected element is shown flashing in the preview.
Properties (à la page 123)	Configuration and display of properties (variables, authorizations, interlockings, linked values).
Events (à la page 129)	Configuration and display of events (functions).
Transformations (à la page 130)	Configuration and display of transformations.
Name	Name of the property.
Connection	Selection of link.
Link type	Type of link (variable, authorization, function)
WPF info	Shows the current value for properties in WPF content. For the user, it is directly visible what type of property it is (Boolean, string, etc.).
Linked	Shows if a property is currently being used. Not contained by default in the view, but can be selected using Context menu->Column selection.

Informations

Only logical objects can be displayed in the configuration dialog. Visual objects are not displayed. You can read about backgrounds and how visual objects can be animated in the Allocation of zenon object to WPF content.

EDIT HYPERLINKS

All configured hyperlinks can be edited from the properties of the element. Click on the element and open the property group **Liens WPF**. Hyperlinks can be further configured here, without having to open the dialog.

Limitations :

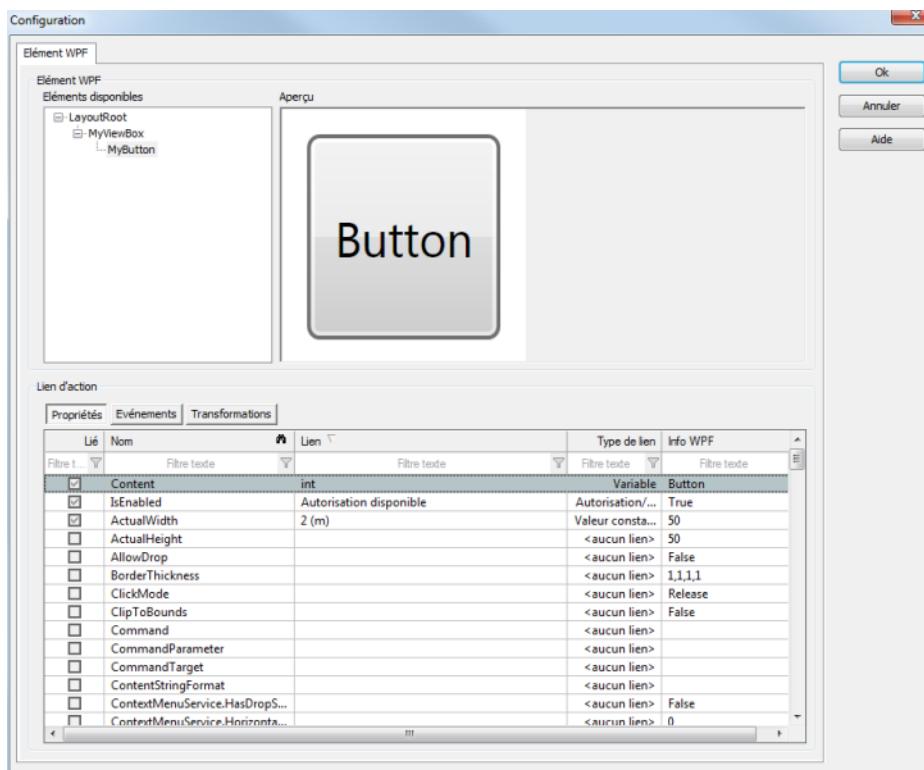

- ▶ Le type de liaison ne peut pas être modifié ici.
- ▶ Les nouveaux liens peuvent uniquement être créés via la boîte de dialogue de configuration.

- ▶ Insertion d'un élément WPF dans un symbole : Les liens WPF ne peuvent pas être exportés.

Properties

The properties enable the linking of:

- ▶ Variables (à la page 125)
- ▶ Values (à la page 126)
- ▶ Authorizations and interlockings (à la page 127)

Parameters	Description
Name	Name of the property.
Connection	Linked variable, authorization or linked value. Clicking in the column opens the respective selection dialog, depending on the entry in the Link type column.
Link type	Selection of linking.
WPF info	Shows the current value for properties in WPF content. For the user, it is directly visible what type of property it is (Boolean, string, etc.).
Linked	Shows if a property is currently being used. Not contained by default in the view, but can be selected using Context menu->Column selection.

CREATE LINK

To create a link:

1. Highlight the line with the property that is to be linked
2. Click in the **Link type cell**
3. Select the desired link from the drop-down list.

The following are available:

- <not linked> (deletes an existing link)
- Authorization/Interlocking
- Constant value
- Variable

4. Click in the **Link** cell
5. The dialog for configuring the desired link opens

Informations

*Properties of WPF and zenon can be different. If, for example the **visibility** property is linked, there are three values available in .NET:*

0 - visible

1 - invisible

2- collapsed

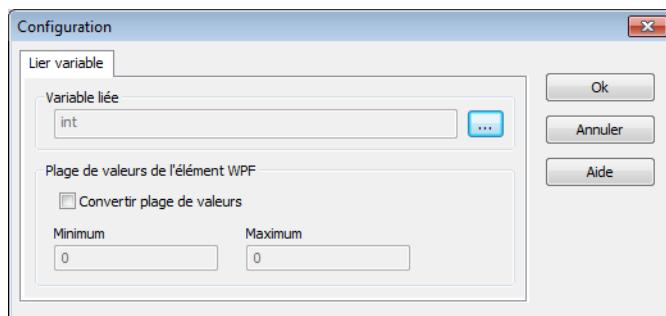

These values must be displayed via the linked zenon variable.

Link variable

To link a variable with a WPF property:

1. Highlight the line with the property that is to be linked
2. Click in the **Link type cell**
3. Select from the **variable** drop down list
4. Click in the **Link** cell
5. The dialog for configuring the variables opens

This dialog also applies for the selection of variables with transformations (à la page 130). The configuration also makes it possible to convert from zenon into WPF units.

Parameters	Description
Linked variables	Selection of the variable to be linked. A click on the ... button opens the selection dialog.
Value range of WPF element	Data to convert variable values into WPF values.
Convert value range Active: WPF unit conversion is switched on. Effect on Runtime: The current zenon value (incl. zenon unit) is converted to the WPF range using standardized minimum and maximum values. For example: The value of a variable varies from 100 to 200. With the variables, the standardized range is set to 100 - 200. The aim is to display this change in value using a WPF rotary knob. For this: <ul style="list-style-type: none"> ▶ for Transformations, the RotateTransform.Angle property is linked to the variables ▶ Adjust value activated ▶ a WPF value range of 0 to 360 is configured Now the rotary knob can be turned at a value of 150, for example, by 180 degrees.	
Minimum	Defines the lowest WPF value.
Maximum	Defines the highest WPF value.
OK	Accepts settings and ends the dialog.
Cancel	Discards settings and ends the dialog.
Help	Opens online help.

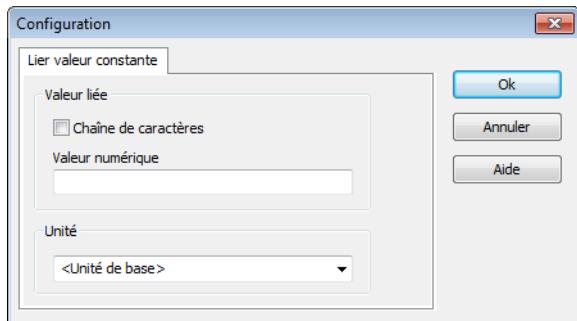

Link values

Linked values can either be a **String** or a numerical value of the type **Double**. When selecting the screen, the selected value is sent in WPF content after loading the WPF content.

To link a value with a WPF property:

1. Highlight the line with the property that is to be linked
2. Click in the **Link type cell**
3. Select **Value linkings** from the drop-down list
4. Click in the **Link** cell

5. The dialog for configuration of value linking opens

Parameters	Description
Linked value:	Entry of a numerical value or string value.
Use string	<p>Active: A string value is used instead of a numerical value.</p> <p>The language of string values can be switched. The text is translated in Runtime when the screen is called up and sent in WPF content. If the language is switched whilst the screen is opened, the string value is retranslated and sent.</p>
String value/numerical value	Depending on what is selected for the Use string property, a numerical value or a string value is entered into this field. For numerical values, a unit of measurement can also be selected.
Unit:	<p>Selection of a unit of measurement from the drop down list. You must have configured this in unit switching beforehand.</p> <p>The unit of measurement is allocated with the numerical value. If the units are switched in Runtime, the value is converted to the new unit of measurement and sent to WPF content.</p>
OK	Accepts settings and ends the dialog.
Cancel	Discards settings and ends the dialog.
Help	Opens online help.

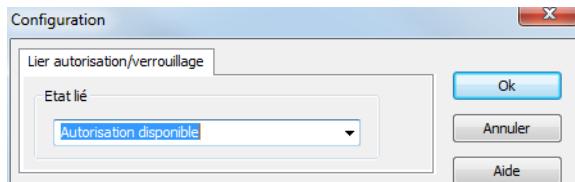

Link authorization or interlocking

Authorizations cannot be granted for the whole WPF element. The element is allocated a user level. Authorizations are granted within the user level for individual controls. If an authorization is active, the value 1 is written to the element.

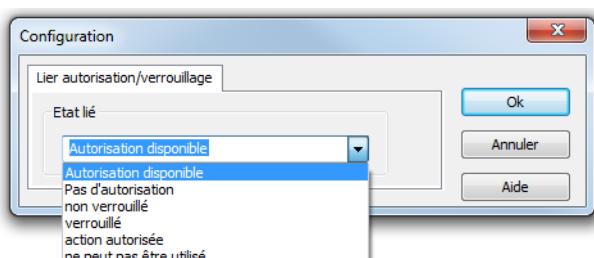

To link an authorization or interlocking with a WPF property:

1. Highlight the line with the property that is to be linked

2. Click in the **Link type cell**
3. Select **Authorization/interlocking** from the drop down menu
4. Click in the **Link** cell
5. The dialog for configuring the authorizations opens

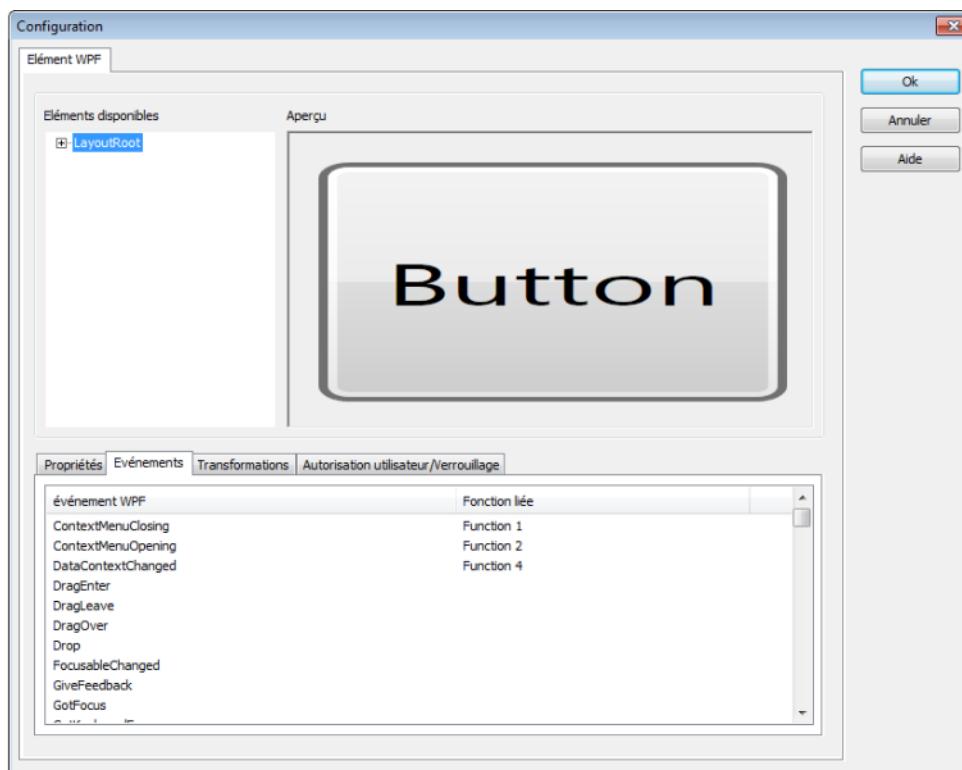

Parameters	Description
Link authorization/interlocking	Setting the authorizations.
Linked status	Selection of an authorization that is linked to a WPF control from the drop down list. For example, visibility and operability of a WPF button can depend on a user's status.

Authorization	Description
Authorization available	If the user has sufficient rights to operate the WPF element , a value of 1 is written to the property.
Authorization does not exist	If the user does not have sufficient rights to operate the WPF element , a value of 1 is written to the property.
Not interlocked	If the element is not locked, the value 1 is written to the property.
Interlocked	If the element is locked, the value 1 is written to the property.
Can be operated	If authorization is present and the element is not locked, then a value of 1 is written to the property.
Cannot be operated	If authorization is not present or the element is not locked, then a value of 1 is written to the property.

Events

Events make it possible to link zenon functions to a WPF element.

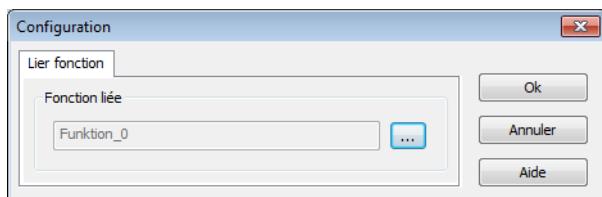

Parameters	Description
Name	Name of the property.
Connection	Linked function. Clicking in the cell opens the configuration dialog.
Link type	Selection of linking. Clicking in the cell opens the selection dialog.
WPF info	Shows the current value for properties in WPF content. For the user, it is directly visible what type of property it is (Boolean, string, etc.).
Linked	Shows if a property is currently being used. Not contained by default in the view, but can be selected using Context menu->Column selection.

LINK FUNCTIONS

To create a link:

1. Highlight the line with the property that is to be linked

2. Click in the **Link type cell**
3. Select from the drop down list function
4. Click in the **Link** cell
5. The dialog for configuring the function opens

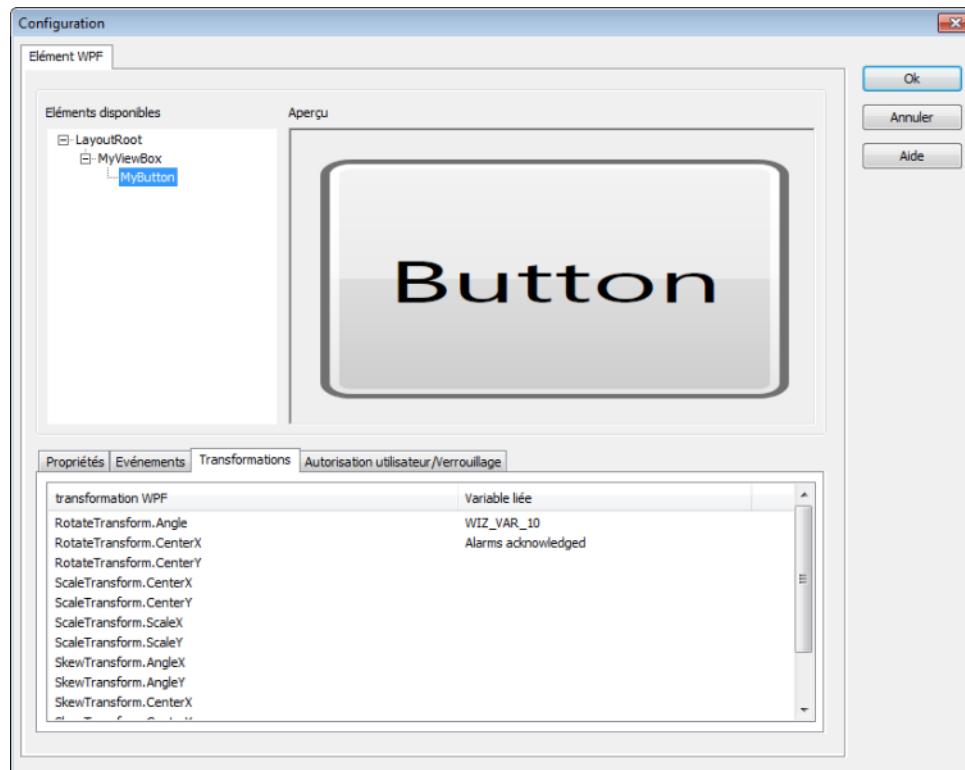

Parameters	Description
Linked function	Selection of the function to be linked. Clicking on the ... button opens the dialog for Function selection.
OK	Accepts selection and closes dialog.
Cancel	Discards changes and closes dialog.
Help	Opens online help.

Transformation

The **WPF element** does not support rotation. If, for example, the **WPF element** is in a symbol and the symbol is rotated, the **WPF element** does not rotate with it. Therefore there is a different mechanism for **Transformation** with WPF to turn elements or to otherwise transform them. These transformations are configured in the **Transformation** tab.

Attention: If the content is outside of the **WPF element** area, this part of the contents is lost or it is not shown.

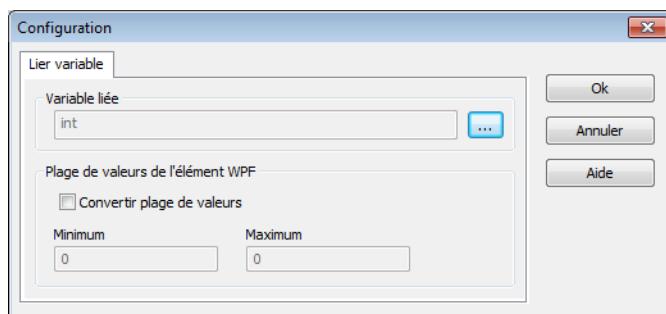

Parameters	Description
Name	Name of the property.
Connection	<p>Selection of the linked variables.</p> <p>Transformations are displayed in XAML as transformation objects with their own properties. If an element supports a transformation, then the possible properties of the transformation object are displayed in list view. (more on this in: Integrate button as WPF XAML in zenon (à la page 170)</p> <p>For example, if the linked variable is set at the value of 10, then this value is written as a WPF target and the WPF element is rotated by 10°.</p>
Link type	Selection of transformation link type.
WPF info	Shows the current value for properties in WPF content. For the user, it is directly visible what type of property it is (Boolean, string, etc.).
Linked	<p>Shows if a property is currently being used.</p> <p>Not contained by default in the view, but can be selected using Context menu->Column selection.</p>

LINK TRANSFORMATIONS

To link a transformation with a WPF property:

1. Highlight the line with the property that is to be linked
2. Click in the **Link type cell**
3. Select from the **Transformation** drop down list
4. Click in the **Link** cell
5. The dialog for configuring the variables opens

The configuration also makes it possible to convert from zenon into WPF units.

Parameters	Description
Linked variables	Selection of the variable to be linked. A click on the ... button opens the selection dialog.
Value range of WPF element	Data to convert variable values into WPF values.
Convert value range Active: WPF unit conversion is switched on. Effect on Runtime: The current zenon value (incl. zenon unit) is converted to the WPF range using standardized minimum and maximum values. For example: The value of a variable varies from 100 to 200. With the variables, the standardized range is set to 100 - 200. The aim is to display this change in value using a WPF rotary knob. For this:	<ul style="list-style-type: none"> ▶ for Transformations, the RotateTransform.Angle property is linked to the variables ▶ Adjust value activated ▶ a WPF value range of 0 to 360 is configured <p>Now the rotary knob can be turned at a value of 150, for example, by 180 degrees.</p>
Minimum	Defines the lowest WPF value.
Maximum	Defines the highest WPF value.
OK	Accepts settings and ends the dialog.
Cancel	Discards settings and ends the dialog.
Help	Opens online help.

6.4.4 Validity of XAML Files

XAML files are valid subject to certain requirements:

- ▶ Correct name spaces
- ▶ No class references
- ▶ Scalability

CORRECT NAME SPACE

The **WPF element** can only display WPF content, i.e.:

Only XAML files with the correct WPF namespace can be displayed by the **WPF element**. Files that use a Silverlight namespace cannot be loaded or displayed. However, in most cases it is suffice to change the Silverlight namespace to the WPF namespace.

WPF-Namespace:

```
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"  
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
```

NO USE OF CLASS REFERENCES

Because the XAML files can be loaded dynamically, it is not possible to use XAML files that contain references to classes ("class" key in header). Functions that have been programmed in independently-created C#- files cannot be used.

In order to use WPF user controls with code behind, the process as described in the Creating a simple WPF user control with code behind function (à la page 96) must be carried out.

SCALABILITY

If the content of a **WPF element** is adjusted to the size of the **WPF element**, then the controls of the **WPF element** are interlaced in a control that offers this functionality, such as a **view box** for example. In addition, it must be ensured that the **height** and **width** for this elements are configured as **automatic**.

CHECKING AN XAML FILE TO SEE IF IT IS CORRECT

To check if an XAML file has the correct format:

- ▶ Open XAML file in Internet Explorer
 - If it can be opened without additional plug-ins (Java or similar), then it can be assumed with a high degree of certainty that this file can be loaded or displayed by zenon
 - if problems occur during loading, these are then shown in Internet Explorer and the lines in which problems arise can be clearly seen

The scaling can also be tested in this manner: If the file has been created correctly, the content will adjust to the size of the Internet Explorer window.

ERROR MESSAGE

If an invalid file is used in zenon, then an error message is displayed in the output window when loading the file in the WPF element.

For example:

"error when loading

```
xaml-Datei:C:\ProgramData\COPA-DATA\SQL\781b1352-59d0-437e-a173-08563c3142e9\FILES\zenon\custom\media\UserControl1.xaml
```

The attribute "Class" cannot be found in XML namespace
["http://schemas.microsoft.com/winfx/2006/xaml"](http://schemas.microsoft.com/winfx/2006/xaml). Line 7 Position 2."

6.4.5 Pre-built elements

zenon is already shipped with several WPF elements. More are available for download in the web shop.

All WPF elements have properties which determine the graphical design of the respective element (Dependency Properties). Setting the values via an XAML file or linking the property via zenon can directly change the look in the Runtime. The tables in the description of the individual elements contain the respective Dependency Properties, depending on the control.

Available elements:

- ▶ Analog clock (à la page 136)
- ▶ Vertical bar graph (à la page 136)
- ▶ Comtrade Viewer (à la page 137)
- ▶ Energy class diagram (à la page 147)
- ▶ Progress bar (à la page 137)
- ▶ Pareto diagram (à la page 148)
- ▶ Sankey diagram (à la page 155)
- ▶ Round display (à la page 152)
- ▶ Temperature control (à la page 157)
- ▶ Universal slider (à la page 158)
- ▶ Waterfall diagram (à la page 159)

REPLACING ASSEMBLY WITH A NEWER VERSION

Per project only one assembly for a WPF element can be used in the zenon Editor as well as in the Runtime. If two versions of an assembly are available in a project, then the first loaded file is used. A user enquiry is made as to which version should be used. No further actions are needed for the maintenance of the versions used up until now. If a newer version is chosen, all corresponding CDWPF files in all symbols and images in all projects must be adapted.

Note for Multi-Project Administration: If an assembly in a project is replaced by a new version, it must also be replaced in all other projects that are loaded in the Editor or in Runtime.

Analog clock - AnalogClockControl

Property	Function	Value
ElementStyle	Shape/type of element.	Enum: ▶ SmallNumbers ▶ BigNumbers ▶ No
ElementBackgroundBrush	Color of element background.	Brush
ElementGlasReflection	Activate the glass effect on the element.	Visibility
Offset	Value in hours (h) which displays the time lag to the system clock.	Int16
OriginText	Text which is displayed in the clock (e.g. location).	String

Bar graph vertical - VerticalBargraphControl

Property	Function	Value
CurrentValue	Current value which should be displayed.	Double
MinValue	Minimum value of the scale.	Double
MaxValue	Maximum value of the scale.	Double
MajorTicksCount	Number of main ticks on the scale.	Integer
MinorTicksCount	Number of sub ticks on the scale.	Integer
MajorTickColor	Color of main ticks on the scale.	Color
MinorTickColor	Color of sub ticks on the scale.	Color
ElementBorderBrush	Color of the element border.	Brush
ElementBackgroundBrush	Color of element background.	Brush
ElementGlasReflection	Activate the glass effect on the element.	Visibility
ElementFontFamily	Element font.	Font
ScaleFontSize	Font size of the scale.	Double
ScaleFontColor	Font color of the scale.	Color
IndicatorBrush	Bar graph fill color.	Brush
BargraphSeparation	Number of bar graph division.	Integer
BargraphSeparationColor	Color of the scale division.	Color

Progress bar - ProgressBarControl

Property	Function	Value
CurrentValue	Current value which should be displayed.	Double
MinValue	Minimum value of the value area.	Double
MaxValue	Maximum value of the value area.	Double
ProgressbarDivisionCount	Number of divisions of the progress bar.	Integer
VisibilityText	Visibility of the value display.	Boolean
TextSize	Font size of the value display.	Double
TextColor	Color of the value display.	Color
ProgressBarBoxedColor	Color of the border of the progress bar.	Color
ProgressBarMarginDistance	Distance of the progress bar box from the element edge (left, top, right, down).	Double
ProgressBarInactiveBrush	Indicator color not active.	Brush
ProgressBarActiveBrush	Indicator color active.	Brush
ProgressBarPadding	Distance of the progress bar from the progress bar box (left, top, right, down).	Double
ElementBorderBrush	Color of the element border.	Brush
ElementBackgroundBrush	Color of element background.	Brush

COMTRADE-Viewer

The **COMTRADE-Viewer** WPF element is available to partners of COPA-DATA and is available to these via the Partner Portal.

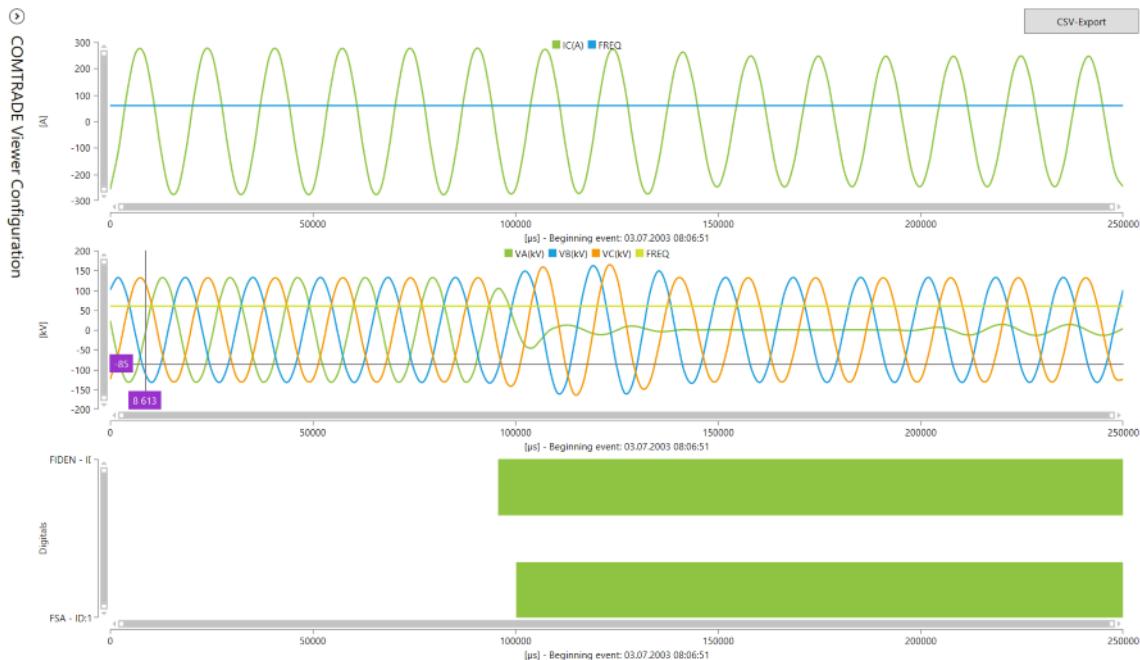

It is for the graphical analysis of digital error and result logging of a COMTRADE file.

Informations

The control supports IEEE C37.111 (IEEE Standard Common Format for Transient Data Exchange (COMTRADE) for Power Systems) standards-compliant files. ASCII or binary files in accordance with the 1999 or 2013 edition can be visualized.

Older files or files without a year identification are not supported. This is displayed with a warning dialog in Runtime.

Possibilities of the **COMTRADE-Viewer** WPF control in zenon Runtime:

- ▶ Selection of a file in the COMTRADE file format
- ▶ Exports selected objects as an CSV file.
- ▶ Visualization of the selected COMTRADE file:
Note: The display colors can be configured in the zenon Editor.
 - Current (sinus wave display)
 - Voltage (sinus wave display)
 - Digital signals (binary bar chart display)
 - Display of values at a selected cursor position.
 - If an element that represents neither current or voltage is selected, (such as frequency), this is visualized in both analog areas again (current and voltage).
- ▶ Navigation:
 - Zoom in and zoom out using the mouse wheel, scroll bar and Multi-Touch gestures
 - Enlargement of the area
Selection of the area by clicking the mouse
 - Move the display area using the right mouse button, scroll bar or Multi-Touch gestures.

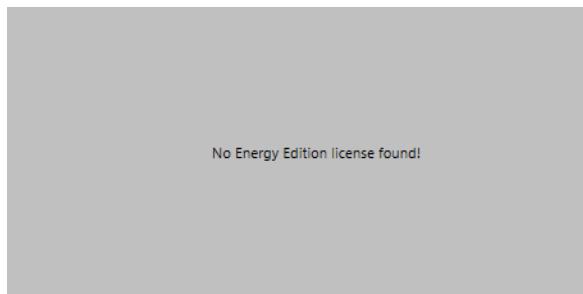

Conseil

To be able to transport COMTRADE files to the zenon Runtime computer, you can also use the file transfer of the **IEC 61850 driver** or the **FTP function block** of zenon Logic.

You can find further information about this in the driver documentation of the IEC 61850 driver or in the zenon Logic documentation.

LICENSING

The **COMTRADE-Viewer** can only be configured in the zenon Editor with a valid Energy Edition license. If there is no valid license, the WPF is displayed as grayed out in the Editor. A valid Energy Edition license is also required for display in Runtime.

No Energy Edition license found!

Display during Runtime

The **COMTRADE** WPF element offers two views in Runtime:

- ▶ Configuration view
 - Selection of a COMTRADE configuration file
 - Selection of the elements to be displayed
- ▶ Graph view
 - Zoom in and zoom out
 - Display of values at a selected cursor position.
 - Export of the selected elements as an CSV file

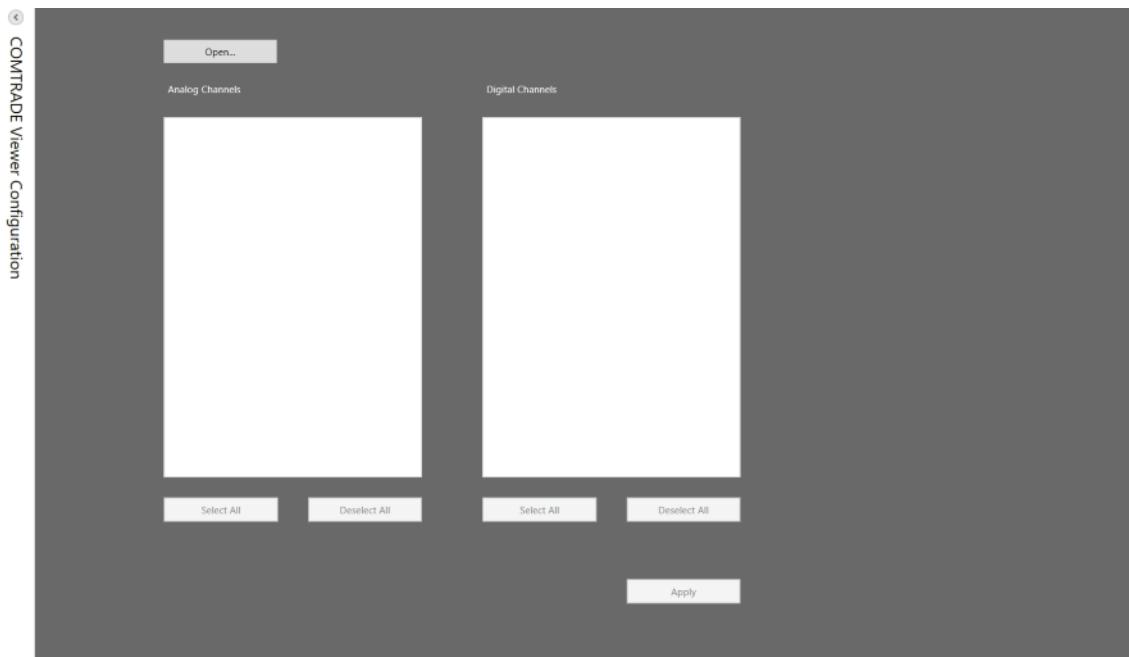

Informations

The switch between the views is integrated in the WPF element. Additional project configuration of a screen switching function is not necessary.

Runtime view - configuration page

If a screen with a configured **COMTRADE-Viewer** WPF element is called up, the display of the respective configuration page is empty.

Note: This also applies if, in zenon Runtime, there is a switch from one screen to another screen with the screen switching function.

COMTRADE VIEWER CONFIGURATION

The **COMTRADE Viewer Configuration** switching, arranged vertically on the side, switches the display of the configuration to graphic view and vice versa.

SELECT FILE

The **Open...** button opens the file selection dialog to select a file.

There is a pre-selection for display in the file selection:

- ▶ In doing so, file pairs of *.cfg- and *.dat files are detected.
Note: Optional *.hdr or *.inf files are not taken into account.
- ▶ Only the corresponding *.dat files are displayed.
- ▶ All attendant files (*.dat, *.cfg) are loaded by clicking on the desired file and the **OK** button.
- ▶ One file can be loaded.
- ▶ After loading the file, the content of the file is shown in the **Analog Channels** and **Digital Channels** columns.

The labels and units of the elements originate from the COMTRADE configuration and cannot be changed.

ANALOG CHANNELS

Parameters	Description
[Liste der verfügbaren Kanäle]	Selection of the elements to be visualized. Multiple selection by clicking on the desired entry in the list. Selected elements are shown with a colored background. Another mouse click undoes the selection of the entry.
Select All	Selects all elements from the list.
Deselect All	Deactivates the existing selection of elements.

DIGITAL CHANNELS

Parameters	Description
[Liste der verfügbaren Kanäle]	Selection of the elements to be visualized Multiple selection by clicking on the desired entry in the list. Selected elements are shown with a colored background. Another mouse click undoes the selection of the entry.
Select All	Selects all elements from the list.
Deselect All	Deactivates the existing selection of elements.

SHOW SELECTION

To show your selection in the graphic view, click on the **Apply** button.

Note: Clicking on the vertically-arranged **COMTRADE Viewer Configuration** switching only changes the view. An amended selection of the channels is not taken into account in the process.

Runtime view - visualization of COMTRADE data

The selected channels are visualized in the graph view of the **COMTRADE-Viewer** WPF element. The coloring can be configured in the zenon Editor.

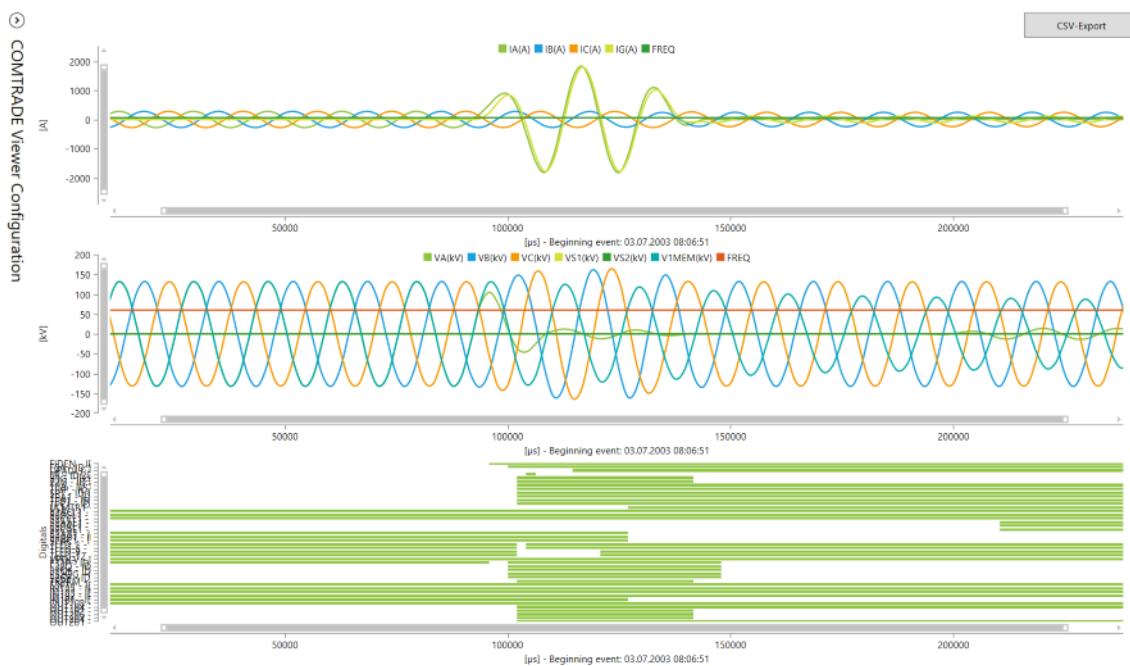

EXPORT OF THE SELECTED DATA

The selected analog and digital channels can be exported to a CSV file with the **CSV-Export** button.

GRAPH VIEW

The graph view of the **COMTRADE-Viewers** is divided into three sections:

- ▶ Current amperage
Upper area
- ▶ Voltage
Mid area
- ▶ Digital channels
Lower area

AXIS LABELING

- ▶ Horizontal axis
The horizontal axis represents the complete time period as illustrated in the COMTRADE file (*.dat).
The scaling of this time axis depends on the enlargement level. The higher the enlargement selected, the more detailed the time display.
- ▶ Vertical axis
The vertical axis represents the values.
 - The scaling of the value axis depends on the enlargement level. The greater the enlargement selected, the more detailed the display of values.
 - The labeling of the analog channels is shown vertically next to the values and corresponds to the measuring unit as defined in the COMTRADE file (*.cfg).

- The digital channels are displayed in the sequence as defined in the COMTRADE file (*.cfg).

The Channel identifier of the COMTRADE file serves as an identifier.

KEY

The color key of the graphs is shown at the head of the graph.

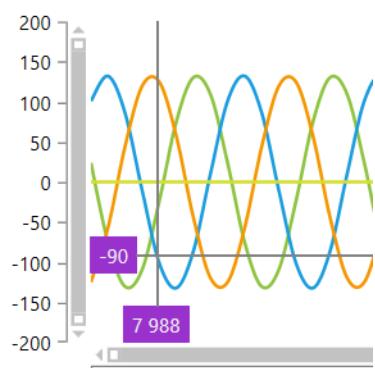

- The labeling of the digital channels corresponds to the channel description as defined in the COMTRADE file (*.cfg).
- The colors for each channel are assigned automatically with the configured color palette.
- The time is displayed in a footer under the graph. The start time is displayed as a text.

NAVIGATION AND ZOOM

Navigation (scroll and zoom) is always applied to all three areas of the graphic display.

- You can move the display within the horizontal time line with the scroll bar.
- Zoom in and zoom out
 - You can zoom at the current position of the mouse pointer in the graphics view or reduce the enlargement.
 - The selected area is displayed by selecting a display area with the mouse button held down.
Note: The display of the values is always amended to the selected area. As a result, this can lead to a flattening of the curve in the enlarged graphic view.
 - Double clicking on the scroll bar resets the enlargement.

ANALYSIS

The precise values at the position of the mouse pointer are visualized with a display in value blocks. A crosshair offers additional visual support with the exact determination of the reading position.

Configurable control properties - color display

ENGINEERING IN THE EDITOR

The element with the name **COMTRADE.CDWPF** can be configured and placed in each zenon screen type.

The project configuration of **Largeur [pixels]** and **Hauteur [pixels]** of the element depend on the proportions. This prevents the **COMTRADE-Viewer** being displayed as distorted in Runtime.

Note: When configuring the project, ensure that there is sufficient size to guarantee a clear overview.

GRAPHICAL AMENDMENTS

You configure the graphic design in the properties of the WPF element.

You can find further information in the configuration of the linking (à la page 121) chapter in this manual.

Possible color values:

- ▶ Hexadecimal color values

#RRGGBB

Example color values: #000000 = black , #FFFFFF = white, #FF0000 = red

- ▶ Color values by name

Reference: <https://msdn.microsoft.com/en-us/library/system.drawing.color.aspx>
[\(https://msdn.microsoft.com/en-us/library/system.drawing.color.aspx\)](https://msdn.microsoft.com/en-us/library/system.drawing.color.aspx)

Conseil

The properties for the **COMTRADE-Viewer** WPF element have a "z" as a starting color. Use name filtering for a clear display when configuring the linking.

CONFIGURATION PAGE

Text and background color of the configuration page.

Analog Channels

Parameters	Description	Value
zConfiguratinPageTextColor	Text color of the configuration page	String
zConfigurationPageBackgroundColor	Background color of the configuration page	String

BUTTONS

Text and background color of the button.

Open...

Parameters	Description	Value
zButtonTextColor	Text color of the button	String
zButtonBackgroundColor	Background color of the button	String

CHART

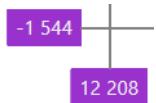

Text color of the axis labeling or key and background color.

50000 60000 70000

Parameters	Description	Value
zChartTextColor	Text color of the axis labeling.	String
zChartBackgroundColor	Background color of the axis labeling	String

LABEL

Text and background color of the display of a selected cursor position.

Parameters	Description	Value
zChartLabelTextColor	Text color of the value display	String
zChartLabelBackgroundColor	Background color of the value display	String

CHART

Color palette of the graph view and the attendant keys.

Parameters	Description	Value
zChartPalette	<p>Color palette of the colors for graphs and keys.</p> <p>Referencing with color palette name (see overview).</p> <p>Default: if no color palette is configured, the color palette of the computer's operating system is used.</p>	String

POSSIBLE COLOR PALETTES - OVERVIEW

Forest	
Grayscale	
Ground	
Lilac	
Natural	
Pastel	
Rainbow	
Spring	
Summer	
Warm	
Windows8	

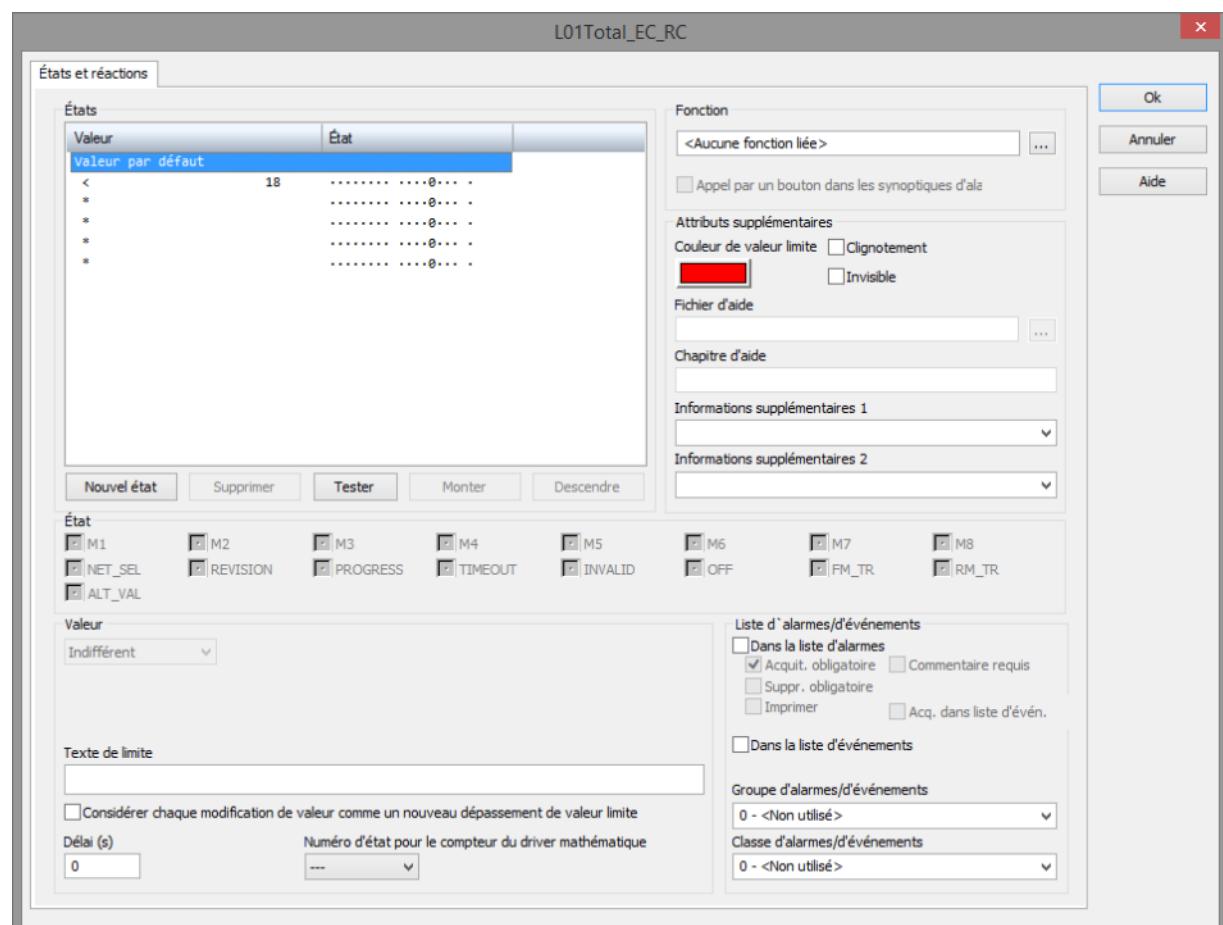

Energy class diagram

The energy class diagram, WPF element is available to partners of COPA-DATA and is available to these via the Partner Portal.

A reaction matrix must be used to model an energy class diagram. This reaction matrix must be linked to the variable whose value is envisaged for display and distribution in energy classes. The name of the variable must be transferred to the "zVariableName" property.

REACTION MATRIX FOR ENERGY CLASS DIAGRAM

The screenshot shows the configuration dialog for a reaction matrix named "L01Total_EC_RC". The dialog is divided into several sections:

- États et réactions**: Contains a table of states (Valeur) and their corresponding values (Etat).
- États**: Shows a list of states: M1, M2, M3, M4, M5, M6, M7, M8, NET_SEL, REVISION, PROGRESS, TIMEOUT, INVALID, OFF, FM_TR, RM_TR. Some states have checkboxes next to them.
- Valeur**: A dropdown menu set to "Indifférent".
- Texte de limite**: A text input field.
- Délai (s)**: A numeric input field set to "0".
- Fonction**: A dropdown menu set to "<Aucune fonction liée>".
- Attributs supplémentaires**: Options for limit color (red), blink (checkbox), and invisible (checkbox).
- Fichier d'aide**: A dropdown menu.
- Chapitre d'aide**: A dropdown menu.
- Informations supplémentaires 1**: A dropdown menu.
- Informations supplémentaires 2**: A dropdown menu.
- Liste d'alarmes/d'événements**: Options for alarm handling.
- Groupe d'alarmes/d'événements**: A dropdown menu set to "0 - <Non utilisé>".
- Classe d'alarmes/d'événements**: A dropdown menu set to "0 - <Non utilisé>".

The linked reaction matrix must correspond to the following schematic:

- The first status must be an area, or a "less than" definition

- ▶ As many different areas as desired can then be defined.
- ▶ The last status must be an area or a "greater than" definition.

The following is applicable for project configuration:

1. If the first status is an area and the value of the variable comes under this area, the first status in the diagram is shown nevertheless. The same is applicable for the last status the other way round.
2. The colors that the WPF diagram uses for the classes are the limit value colors that were defined in the reaction matrix.
3. The letters for the classes are set in alphabetical order starting with "A".

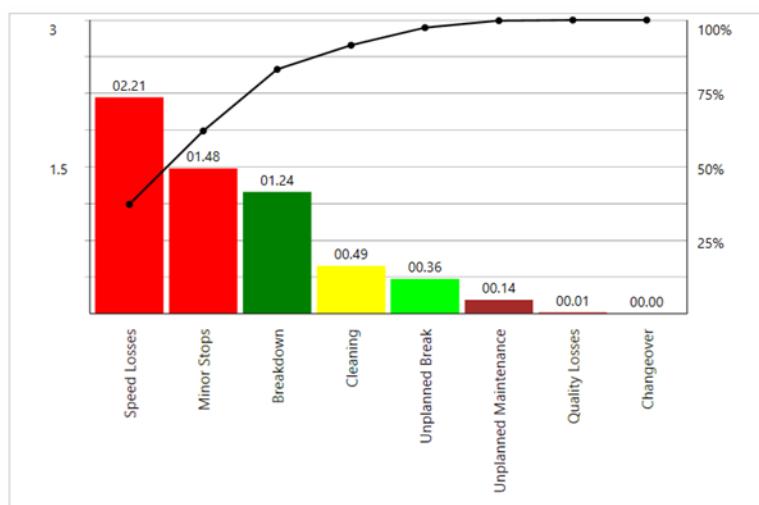

Property	Description	Value
zenonFontID	ID for a font from the first font list (font size is not taken into account)	Integer
zenonNumberOfDecimalPlaces	Number of displayed decimal points	Integer
zenonVariableName	Name of the variable to be displayed.	String

Note: Additional VSTA programming is necessary for the display of the energy class diagram in the zenon web client. You can find details on this in the display of WPF elements in the zenon web client (à la page 160).

Pareto diagram

The Pareto diagram, WPF element is available to partners of COPA-DATA and is available to these via the Partner Portal.

An example of a Pareto diagram in Runtime is shown below:

The following settings can be made in the WPF configuration window under **COPADATA-ELEMENT**:

Property	Function	Value
----------	----------	-------

zenonBarColor1	Color of the first Bar	Color (String)
zenonBarColor2	Color of the second Bar	Color (String)
zenonBarColor3	Color of the third Bar	Color (String)
zenonBarColor4	Color of the fourth Bar	Color (String)
zenonBarColor5	Color of element fifth Bar	Color (String)
zenonBarColor6	Color of element sixth Bar	Color (String)
zenonBarColor7	Color of element seventh Bar	Color (String)
zenonBarColor8	Color of element eighth Bar	Color (String)
zenonBarColor9	Color of element ninth Bar	Color (String)
zenonBarColor10	Color of element tenth Bar	Color (String)
zenonColorPercentageLine	Color of the percentage line (relative sum frequency).	Color (String)
zenonLineVisibility	Visibility of the percentage line (relative sum frequency).	Boolean
zenonVariable1_Label	Labeling for the 1st Bar	String
zenonVariable1_Value	Value of the 1st Bar	Double
zenonVariable2_Label	Labeling for the 2nd Bar	String
zenonVariable2_Value	Value of the 2nd Bar	Double
zenonVariable3_Label	Labeling for the 3rd Bar	String
zenonVariable3_Value	Value of the 3rd Bar	Double
zenonVariable4_Label	Labeling for the 4th Bar	String
zenonVariable4_Value	Value of the 4th Bar	Double
zenonVariable5_Label	Labeling for the 5th Bar	String
zenonVariable5_Value	Value of the 5th Bar	Double
zenonVariable6_Label	Labeling for the 6th Bar	String
zenonVariable6_Value	Value of the 6th Bar	Double
zenonVariable7_Label	Labeling for the 7th Bar	String
zenonVariable7_Value	Value of the 7th Bar	Double

zenonVariable8_Label	Labeling for the 8th Bar	String
zenonVariable8_Value	Value of the 8th Bar	Double
zenonVariable9_Label	Labeling for the 9th Bar	String
zenonVariable9_Value	Value of the 9th Bar	Double
zenonVariable10_Label	Labeling for the 10th Bar	String
zenonVariable10_Value	Value of the 10th Bar	Double

The following events can be used and linked to zenon functions:

Event	Function	Value
zenonBar1Click	Function that is executed when the 1st bar is clicked on.	Function
zenonBar2Click	Function that is executed when the 2nd bar is clicked on.	Function
zenonBar3Click	Function that is executed when the 3rd bar is clicked on.	Function
zenonBar4Click	Function that is executed when the 4th bar is clicked on.	Function
zenonBar5Click	Function that is executed when the 5th bar is clicked on.	Function
zenonBar6Click	Function that is executed when the 6th bar is clicked on.	Function
zenonBar7Click	Function that is executed when the 7th bar is clicked on.	Function
zenonBar8Click	Function that is executed when the 8th bar is clicked on.	Function
zenonBar9Click	Function that is executed when the 9th bar is clicked on.	Function
zenonBar10Click	Function that is executed when the 10th bar is clicked on.	Function

Circular gauge control

Property	Function	Value
CurrentValue	Current value which should be displayed.	Double
IsReversed	Scale orientation - clockwise or anti-clockwise.	Boolean
ElementFontFamily	Element font.	Font
MinValue	Minimum value of the scale.	Double
MaxValue	Maximum value of the scale.	Double
ScaleRadius	Radius of the scale.	Double
ScaleStartAngle	Angle at which the scale starts.	Double
ScaleLabelRotationMode	Alignment of the scale caption.	Enum: ▶ None ▶ Automatic ▶ SurroundIn ▶ SurroundOut
ScaleSweepAngle	Angel area which defines the size of the scale.	Double
ScaleLabelFontSize	Font size of the scale caption.	Double
ScaleLabelColor	Font color of the scale caption.	Color
ScaleLabelRadius	Radius on which the scale caption is orientated.	Double
ScaleValuePrecision	Accuracy of the scale caption.	Integer
PointerStyle	Shape of the pointer displaying the value.	Enum: ▶ Arrow ▶ Rectangle ▶ TriangleCap ▶ Pentagon ▶ Triangle
MajorTickColor	Color of main ticks on the scale.	Color
MinorTickColor	Color of sub ticks on the scale.	Color
MajorTickSize	Size of main ticks on the scale.	Size
MinorTickSize	Size of sub ticks on the scale.	Size
MajorTicksCount	Number of main ticks on the scale.	Integer
MajorTicksShape	Shape/type of main ticks on the scale.	Enum: ▶ Rectangle

		▶ Trapezoid ▶ Triangle
--	--	---------------------------

MinorTicksShape	Shape/type of sub ticks on the scale.	Enum: ▶ Rectangle ▶ Trapezoid ▶ Triangle
MinorTicksCount	Number of sub ticks on the scale.	Integer
PointerSize	Size of the pointer.	Size
PointerCapRadius	Size of the pointer fastening point.	Double
PointerBorderBrush	Color of pointer border.	Brush
PointerCapStyle	Shape/type of pointer fastening point.	Enum: ▶ BackCap ▶ FrontCap ▶ Screw
PointerCapBorderBrush	Color of pointer fastening point.	Brush
PointerBrush	Color of pointer.	Brush
GaugeBorderBrush	Color of the element border.	Brush
GaugeBackgroundBrush	Color of element background.	Brush
PointerCapColorBrush	Color of pointer fastening point.	Brush
GaugeMiddlePlate	Radius of the element background middle plate.	Double
PointerOffset	Offset of the pointer (displacement).	Double
RangeRadius	Radius of the total range display.	Double
RangeThickness	Thickness of the total range display.	Double
RangeStartValue	Start value of the total range display.	Double
Range1EndValue	End value of the 1st area and start value of the 2nd range.	Double
Range2EndValue	End value of the 2nd area and start value of the 3rd range.	Double
Range3EndValue	End value of the 3rd area and start value of the 4th range.	Double
Range4EndValue	End value of the 4th area and start value of the 5th range.	Double
Range5EndValue	End value of the 5th area and start value of the 6th range.	Double
Range6EndValue	End value of the 6th range.	Double
Range1ColorBrush	Color of the first range.	Brush
Range2ColorBrush	Color of the second range.	Brush
Range3ColorBrush	Color of the third range.	Brush
Range4ColorBrush	Color of the fourth range.	Brush
Range5ColorBrush	Color of element fifth range.	Brush
Range6ColorBrush	Color of element sixth range.	Brush

ScaleOuterBorderBrush	Color of the scale border.	Brush
ScaleBackgroundBrush	Color of scale background.	Brush
ValueTextFrameStyle	Shape/type of value display.	Enum: ▶ LargeFrame ▶ SmallFrame ▶ None
ValueTextContent	Content of the value display.	Enum: ▶ Text ▶ TextValue ▶ Value
ValueFontSize	Font size of the value display.	Double
ValueTextColor	Font size of the value display.	Color
IsGlasReflection	Activate the glass effect on the element.	Boolean
GaugeOffsett	Lowering the rotation point of the whole element.	Double

Sankey diagram

The Sankey diagram, WPF element is available to partners of COPA-DATA and is available to these via the Partner Portal.

The Sankey wizard must be used to model a Sankey diagram. The wizard creates an XML file that is then evaluated by the WPF element. To do this, the **zSankeyName** property must be given the name of the XML file. The XML file must be in the **Other** folder of a project. This is saved there by the wizard.

An example of a Sankey diagram in Runtime is shown below:

The following settings can be made in the WPF configuration window under **COPADATA-ELEMENT**:

Property	Function	Value
FontSize	Font size of the texts.	Integer
zBackgroundColor	Background color of the diagram.	Color (String)
zFontColor	Color of the texts.	Color (String)
zFontFamily	Font of all texts.	Font (String)
zLossDetectionActive	Automatic loss detection activated/deactivated. If true, then losses are automatically shown at a node points as flows.	Boolean
zNoDataText	Text that is displayed if there are no values to display and zPreviewActive is false.	String
zNoValidXMLText	Text that is displayed if no valid XML file with entered name has been found and zPreviewActive is false.	String
zNumberOfDecimalPlaces	Denotes how many decimal places are to be displayed.	Integer
zPreviewActive	Display of a preview activated/deactivated. The preview can be displayed if There is no data present (the modeled diagram is filled with default values) or the XML file was not found or this does not contain a valid definition (an example Sankey diagram is displayed).	Boolean
zRefreshRate	Rate at which the diagram is refreshed in ms.	Integer
zSankeyName	Name of the XML file with the modeling of the diagram.	String
zShowRelativeValues	Display of the values in absolute false or relative values true.	Boolean

Note: Additional VSTA programming is necessary for the display of the Sankey class diagram in the zenon web client. You can find details on this in the display of WPF elements in the zenon web client (à la page 160).

Temperature indicator - TemperatureIndicatorControl

Property	Function	Value
CurrentValue	Current value which should be displayed.	Double
MinValue	Minimum value of the scale.	Double
MaxValue	Maximum value of the scale.	Double
MajorTicksCount	Number of main ticks on the scale.	Integer
MinorTicksCount	Number of sub ticks on the scale.	Integer
TickNegativColor	Color of the negative main tick (gradient to TickPositivColor).	Color
TickPositivColor	Color of the positive main tick (gradient to TickNegativColor).	Color
MinorTickCount	Color of the sub ticks.	Color
ElementBorderBrush	Color of the element border.	Brush
ElementBackgroundBrush	Color of element background.	Brush
ElementGlasReflection	Activate the glass effect on the element.	Visibility
ElementFontFamily	Element font.	Font
IndicatorColor	Color of the indicator fill color.	Color
IndicatorBorderColor	Color of the indicator border.	Color
MajorTickSize	Size of main ticks on the scale.	Size
MinorTickSize	Size of sub ticks on the scale.	Size
ScaleLetteringDistance	Distance of the scale caption (vertical), each x. main tick should be captioned.	Integer
IndicatorScaleDistance	Distance between indicator and scale (horizontal).	Double
ScaleFontSize	Font size of the scale.	Double
ScaleFontColor	Font color of the scale.	Color
Unit	Unit.	String
ElementStyle	Shape/type of element.	Enum: ▶ SmallFrame ▶ Unit ▶ None

Universal slider - UniversalReglerControl

Property	Function	Value
CurrentValue	Current value which should be displayed.	Double
ElementFontFamily	Element font.	Font
MinValue	Minimum value of the scale.	Double
MaxValue	Maximum value of the scale.	Double
Radius		Double
ScaleRadius	Radius of the scale.	Double
ScaleStartAngle	Angle at which the scale starts.	Double
ScaleLabelRotationMode	Alignment of the scale caption.	Enum: ▶ None ▶ Automatic ▶ SurroundIn ▶ SurroundOut
ScaleSweepAngle	Angle area which defines the size of the scale.	Double
ScaleLabelFontSize	Font size of the scale caption.	Double
ScaleLabelColor	Font color of the scale caption.	Color
ScaleLabelRadius	Radius on which the scale caption is orientated.	Double
ScaleValuePrecision	Accuracy of the scale caption.	Integer
ElementStyle	Display type of the element	Enum: ▶ Knob ▶ Plate ▶ None
MajorTickColor	Color of main ticks on the scale.	Color
MinorTickColor	Color of sub ticks on the scale.	Color
MajorTickSize	Size of main ticks on the scale.	Size
MinorTickSize	Size of sub ticks on the scale.	Size
MajorTicksCount	Number of main ticks on the scale.	Integer
MajorTicksShape	Shape/type of main ticks on the scale.	Enum: ▶ Rectangle ▶ Trapezoid ▶ Triangle

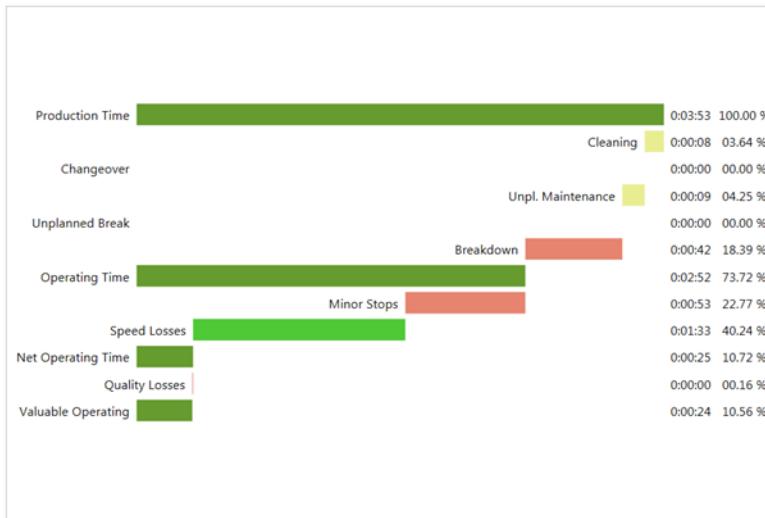

MinorTicksShape	Shape/type of sub ticks on the scale.	Enum: ▶ Rectangle ▶ Trapezoid ▶ Triangle
MinorTicksCount	Number of sub ticks on the scale.	Integer
BackgroundBorderBrush	Color of the element border.	Brush
BackgroundBrush	Color of element background.	Brush
PointerCapColorBrush	Color of pointer fastening point.	Brush
GaugeMiddlePlate	Radius of the element background middle plate.	Double
ValueFontSize	Font size of the value display.	Double
ValueFontColor	Font size of the value display.	Color
IsGlasReflection	Activate the glass effect on the element.	Boolean
KnobBrush	Color of the knob.	Brush
IndicatorBrush	Color of the indicator.	Brush
IndicatorBackgroundBrush	Background color of the inactive indicator.	Brush
KnobSize	Diameter of the knob.	Double
KnobIndicatorSize	Indicator size of the knob.	Size
ElementSize	Size of the element.	Size
VisibilityKnob	Activating of the knob.	Boolean
ValuePosition	Position of the value display.	Double
ValueVisibility	Activating the value display.	Boolean

Waterfall diagram

The waterfall diagram, WPF element is available to partners of COPA-DATA and is available to these via the Partner Portal.

The meaning and waterfall chart wizard must be used to model a waterfall diagram. A waterfall can be modeled with this wizard. The information is saved directly for the variables concerned in the **Analyzer** --> **Parameters for waterfall diagram**.

An example of a waterfall diagram in Runtime is shown below:

Note: This screenshot is only available in English.

The following settings can be made in the WPF configuration window under **COPADATA-ELEMENT**:

Property	Function	Value
zenonRefreshRate	Time between the refreshes of the diagram in ms.	Integer
zenonWaterfallIdentifier	Name of the waterfall diagram.	String
zenonZSystemModel	Equipment group of the variables used.	String

Note: Additional VSTA programming is necessary for the display of the waterfall diagram in the zenon web client. You can find details on this in the display of WPF elements in the zenon web client (à la page 160).

6.4.6 Display of WPF elements in the zenon web client

In order to also be able to also use the pre-made WPF elements "**energy class diagram**", "**Sankey diagram**" and "**waterfall chart**" for the display in a zenon web client, amendments are necessary in the project:

- ▶ Engineering in the zenon Editor (à la page 161)
- ▶ Adapt VSTA code (à la page 161)

Engineering in the zenon Editor

Carry out the following project configuration steps in the zenon Editor, in order to also be able to display certain WPF elements in the zenon web client:

PLACE WPF IN THE ZENON SCREEN:

- ▶ Place the WPF element in a zenon screen.
- ▶ Give it a unique name in the **Nom d'élément** property.
You can find this property in the **Général** properties group.
Note: A warning dialog appears if the name for an element has already been issued in another screen.
- ▶ Use the element name issued here in the VSTA code.

VSTA code (complex)

In order to add the programmer code for the display of WPF elements in the zenon web client, carry out the following steps:

1. In the zenon Editor, switch to the **programmer interfaces** node.
2. Select the **VSTA** node and select the **Open VSTA Editor with project add-in...** with a right mouse click
3. The dialog to create a VSTA project is opened.
4. Select the C# entry in the **Create new VSTA project** dialog.
5. Create (copy) the code below.
6. Enter the name of the WPF element in the code.

Note: When opening the VSTA editor, note whether the content of the following code is already present in the project configuration. For the display of the WPF element in the web client, compare the existing code and undertake the necessary additions. Please note the comments in relation to this in the model code.

VSTA CODE

```
//As member:  
zenOn.IDynPictures zScreens = null;  
string[] WPFElements = { "WPF_Control", "WPFWebclient_1", "WPFWebclient_2" }; //Names of the  
WPF screen elements that appear in the zenon project and that need access to the API (as  
many/few as you want)
```

```
//Add the following three lines of code in the project archive function:  
void ThisProject_Active()  
{  
    zScreens = this.DynPictures();  
    zScreens.Open += new zenOn.DDynPicturesEvents_OpenEventHandler(zScreens_Open);  
    zScreens.Close += new zenOn.DDynPicturesEvents_CloseEventHandler(zScreens_Close);  
}  
  
//Add the following two lines of code in the project inactive function:  
void ThisProject_Inactive()  
{  
    zScreens.Open -= new zenOn.DDynPicturesEvents_OpenEventHandler(zScreens_Open);  
    zScreens.Close -= new zenOn.DDynPicturesEvents_CloseEventHandler(zScreens_Close);  
  
    //Final release and garbage collection of any API-Objects.  
    FreeObjects();  
}  
  
//Add two new event handlers:  
void zScreens_Open(zenOn.IDynPicture obDynPicture)  
{  
    foreach (string element in WPFElements)  
    {  
        if (obDynPicture.Elements().Item(element) != null)  
        {  
            obDynPicture.Elements().Item(element).set_WPFProperty("ELEMENT",  
"zenonVariableLink", this.Variables().Item(0));  
        }  
    }  
}  
  
void zScreens_Close(zenOn.IDynPicture obDynPicture)  
{  
    foreach (string element in WPFElements)  
    {  
        if (obDynPicture.Elements().Item(element) != null)  
        {  
            zenOn.IElement zWPFElement= obDynPicture.Elements().Item(element);  
            zWPFElement.set_WPFProperty("ELEMENT", "zenonTrigger", true);  
            zWPFElement = null;  
        }  
    }  
}
```

```

    }
}

}

```

VSTA code (simplified)

If only one WPF element is used in a zenon screen, the following more streamlined code can be used as an alternative. To do this, the names of the WPF element, and the screen in which the element is used, must be entered. This code is then recommended if, for each project, only one of the pre-made WPF elements is used.

VSTA CODE

```

zenOn.IDynPicture zScreen = zero;
string wpfElement = "WPF_Control"; //Name of the WPF element in the screen
string wpfPicture = "@Details_Overview_Online"; //Name of the zenon screen

//Add to the project active function:
void ThisProject_Active()
{
    zScreen = this.DynPictures().Item(wpfPicture);
    zScreen.Open += new zenOn.OpenEventHandler(zScreen_Open);
    zScreen.Close += new zenOn.CloseEventHandler(zScreen_Close);
}

//Add to the project inactive function:
void ThisProject_Inactive()
{
    zScreen.Open -= new zenOn.OpenEventHandler(zScreen_Open);
    zScreen.Close -= new zenOn.CloseEventHandler(zScreen_Close);

    //Final release and garbage collection of any API-Objects.
    FreeObjects();
}

void zScreen_Open()
{
    if (zScreen.Elements().Item(wpfElement) != null)
    {

```

```

zScreen.Elements().Item(wpfElement).set_WPFProperty("ELEMENT",
"zenonVariableLink", this.Variables().Item(0));
}

}

void zScreen_Close()
{
    if (zScreen.Elements().Item(wpfElement) != null)
    {
        zenOn.IElement zWPFElement = zScreen.Elements().Item(wpfElement);
        zWPFElement.set_WPFProperty("ELEMENT", "zenonTrigger", true);
        zWPFElement = null;
    }
}

```

6.4.7 Examples: Integration of WPF in zenon

You can see how XAML files are created and integrated as WPF elements in zenon from the following examples:

- ▶ Integrate button as WPF XAML in zenon (à la page 170)
- ▶ Integrate bar graph as WPF XAML in zenon (à la page 164)
- ▶ Integrate DataGridView Control in zenon (à la page 176)

Integrate bar graph as WPF XAML in zenon

Example structure:

- ▶ Creating a bar graph (à la page 88) in Adobe Illustrator and converting it to WPF
- ▶ Integrate into zenon
- ▶ Linking with variables
- ▶ Adapting the bar graph WPF element

CREATE BAR GRAPH

The first step is to generate a bar graph as described in the Workflow with Adobe Illustrator (à la page 88) chapter. To be able to use the XAML file in zenon, insert this in the project tree in the **Files/graphics** folder.

INTEGRATE BAR GRAPH

Note: A zenon project with the following content is used for the following description:

- ▶ An empty screen as a start screen
- ▶ Four variables from the internal driver for
 - Scale 0
 - Scale central
 - Scale high
 - Current value
- ▶ A variable from the mathematics driver for displaying the current value (255)

To integrate the bar graph:

1. open the empty screen
2. place a **WPF element** (à la page 120) in the screen
3. select **Fichier XAML** in the properties window
4. Select the desired XAML file (for example **bar graph_vertical.xaml**) and close the dialog

ADJUST BAR GRAPH

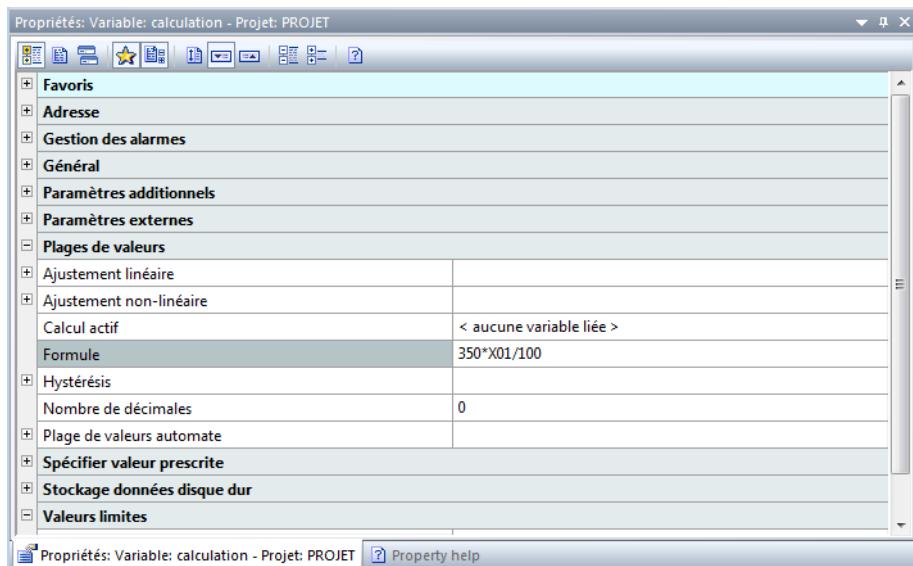

Before configuration, the scale of the XAML file is adapted if necessary:

To do this:

- Create a new mathematics variable that calculates the new value in relation to the scaling, for example:
- Variable: 0-1000

- Mathematic variable {value created in xaml file}*Variable/1000

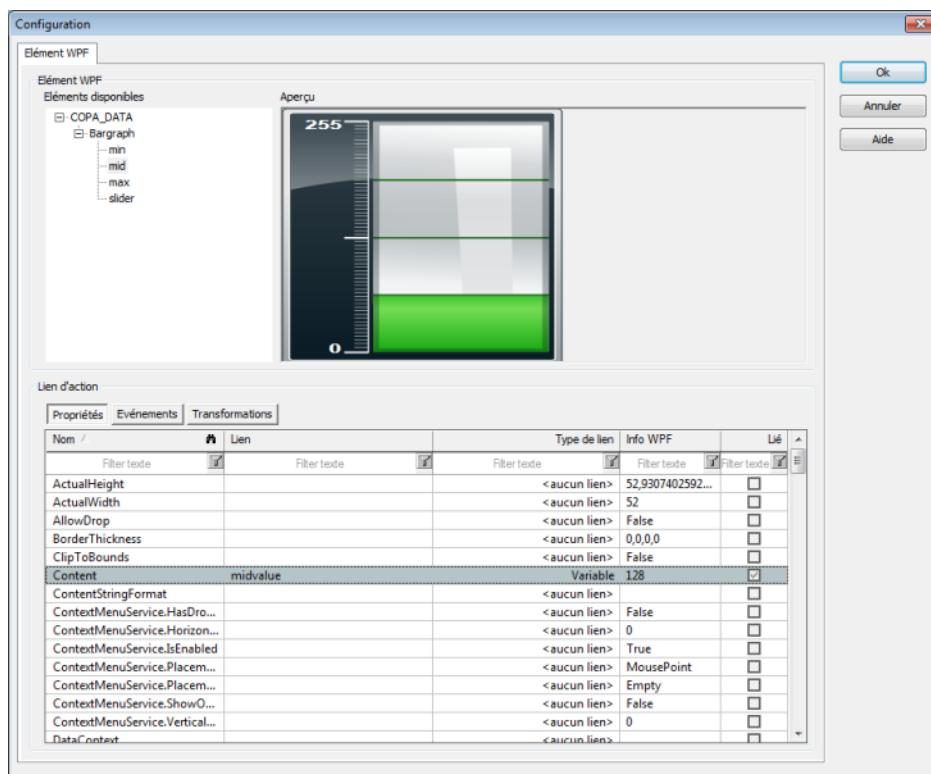

The XAML file is then configured.

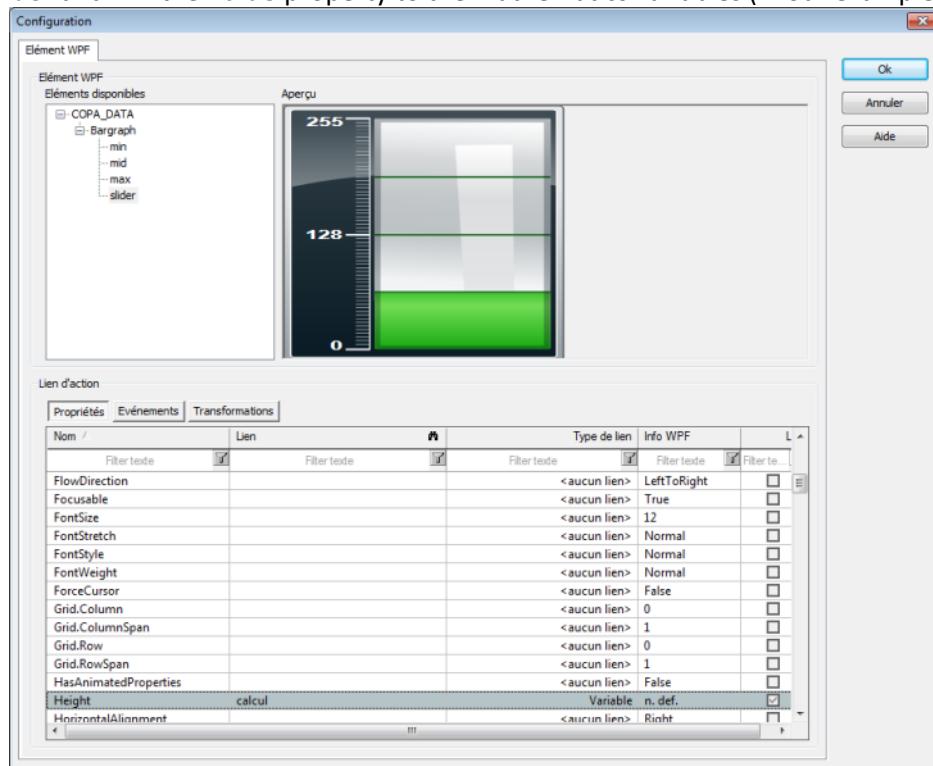

CONFIGURE BAR GRAPH

1. Click on the WPF element and select the Configuration property
2. The configuration dialog shows a preview of the selected XAML file.

3. Select the minimum value, the average value and the maximum value and link each of these to the corresponding variable in the **Content** property

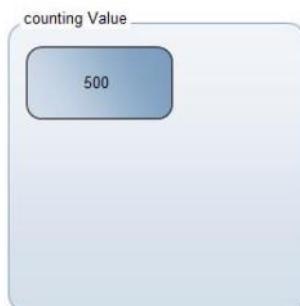

4. Select the **Slider** and link the **Value** property to the mathematics variables (in our example:

calculation)

5. Check the project planning in Runtime:

Integrate button as WPF XAML in zenon

Example structure:

- ▶ Creating a button (à la page 85) in Microsoft Expression Blend
- ▶ Integrate into zenon
- ▶ Link to a variable and a function
- ▶ adjust the button to the size of the element
- ▶ Create button

As a first step, create a button as described in the Create button as XAML file with Microsoft Expression Blend (à la page 85) chapter. To be able to use the XAML file in zenon, insert this in the project tree in the **Files/graphics** folder.

INTEGRATE BUTTON

Note: A zenon project with the following content is used for the following description:

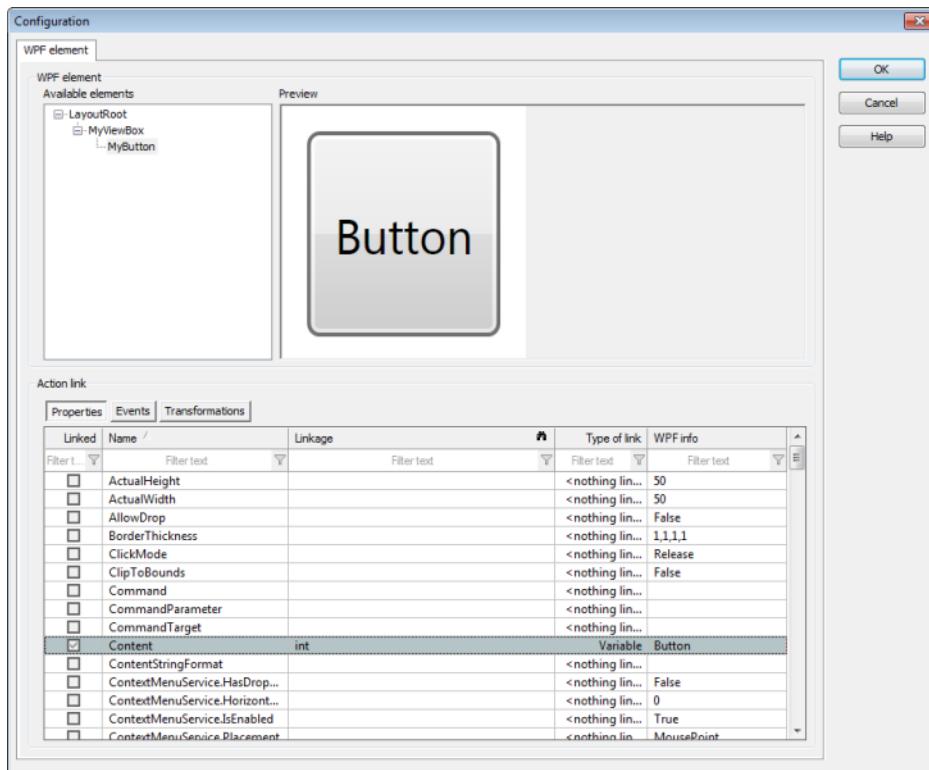

- ▶ An empty screen as a start screen
- ▶ an internal variable **int** of type **Int**
- ▶ a function **Funktion_0** of type**Send value to hardware** with:
 - **Direct to hardware** option activated
 - Set was set to 45

To integrate the button:

1. open the empty screen
2. place a **WPF element** (à la page 120) in the screen
3. select **Fichier XAML** in the properties window
4. select the XAML file (e. g. **MyButton.xaml**) and close the dialog
5. select the **Configuration** property

CONFIGURE THE BUTTON

The configuration dialog shows a preview of the selected XAML file. All elements named in the XAML file are listed in the tree:

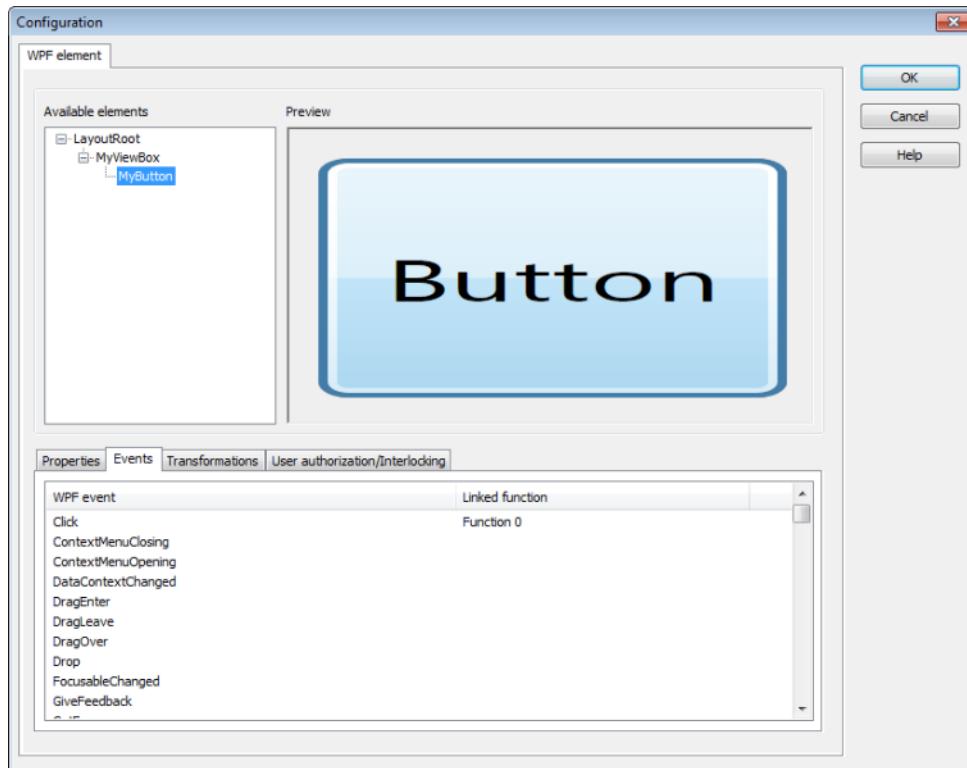

1. select the WPF button, which is in LayoutRoot->MyViewBox->MyButton
2. Look in the **Properties** Entry**Content** tab; this contains the button's text
3. Click the **Link type** column
4. Select **Variable** from the drop down list
5. Click in the **Link** column
6. the variable selection dialog is opened
7. select the **int** variable to link this variable with the **Content** property

EVENTS

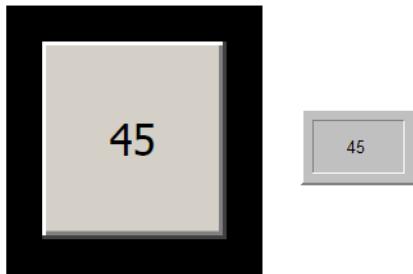

To also assign events:

1. select the events tab

2. look for the 'Click' entry, this event is triggered by the WPF element, as soon as the button is clicked
3. Click in the **Link type** column
4. Select **Function** from the drop down list
5. Click in the **Link** column
6. the **function selection dialog** is opened
7. select **Function_0**
8. Confirm the changes with **OK**
9. Insert a **numerical value element** into the screen
10. Link this **numerical value element** to the `int` variables too.
11. Compile the Runtime files and start Runtime.

The **WPF element** is displayed in Runtime, the button text is 0. As soon as you click on the button, the **click** event is triggered and the **set value** function is carried out. The value 45 is sent directly to the hardware and both **numerical value** and **button** display the value 45 .

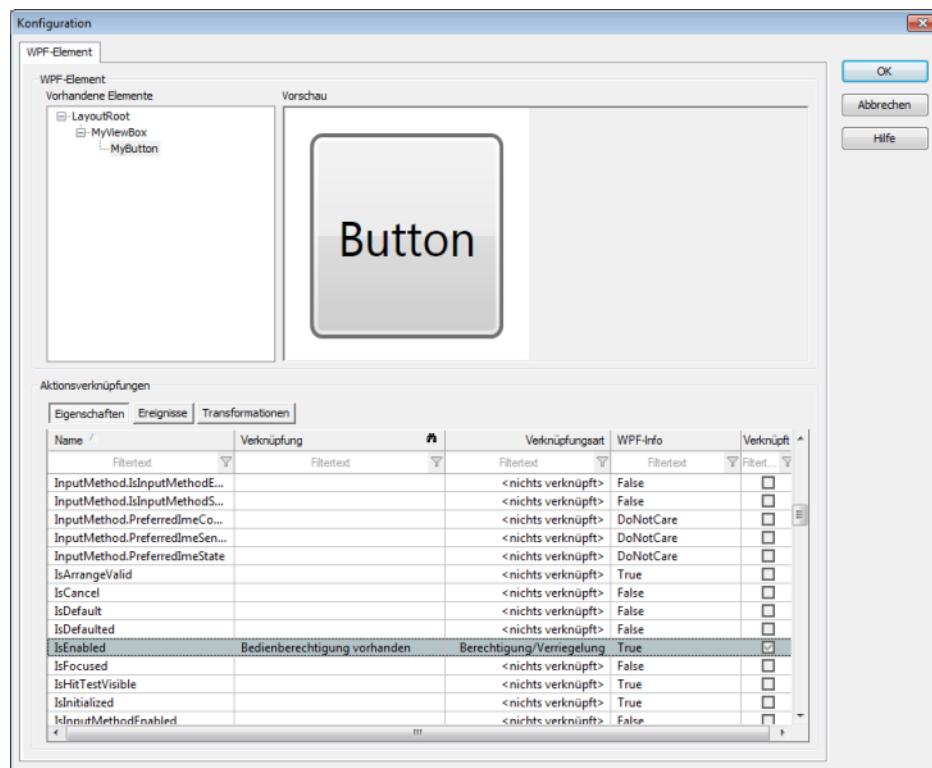

Define a set value of 30 via the **numerical value element**; this value is then also assumed by the **WPF element**.

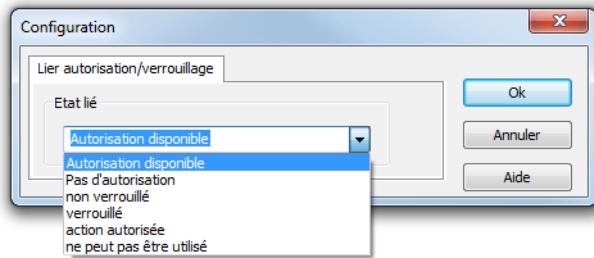

AUTHORIZATION

Similar to a **numerical value**, a **WPF element** can be locked according to authorizations (lock symbol) or switched to be operable. Set the user authorization level to 1 for the **WPF element** and create a user called **Test** with **authorization level 1**. In addition, set up the functions **Login with dialog** and **Logout**. You link these two functions with 2 new text buttons on the screen.

In the **WPF element** configuration dialog, select the **MyButton** WPF button and select the **Properties:** tab

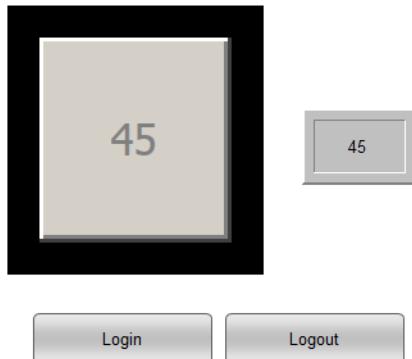

1. Select the **IsEnabled** element
2. Click in the **Link type** column
3. Select **Authorizations/interlocking** from the drop down list
4. Click in the **Link** column
5. In the drop-down list, select the Authorized option

6. Close the dialog with **OK**

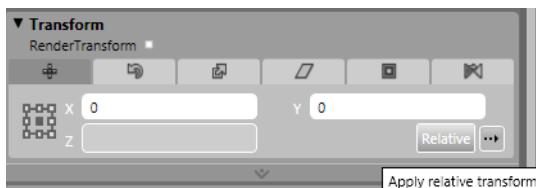

Compile the Runtime file and note that Authorizations to be Transferred must also be selected. After Runtime has been started, the WPF button is displayed as deactivated on the screen and cannot be operated. If you now log in as the user **Test**, the button is activated and can be operated. The button is locked again as soon as you log out.

TRANSFORMATION

The XAML files must still be adapted to use transformations:

1. switch to the **Expression Blend** program
2. select **MyButton**, so that the properties of the element are visible in the events window

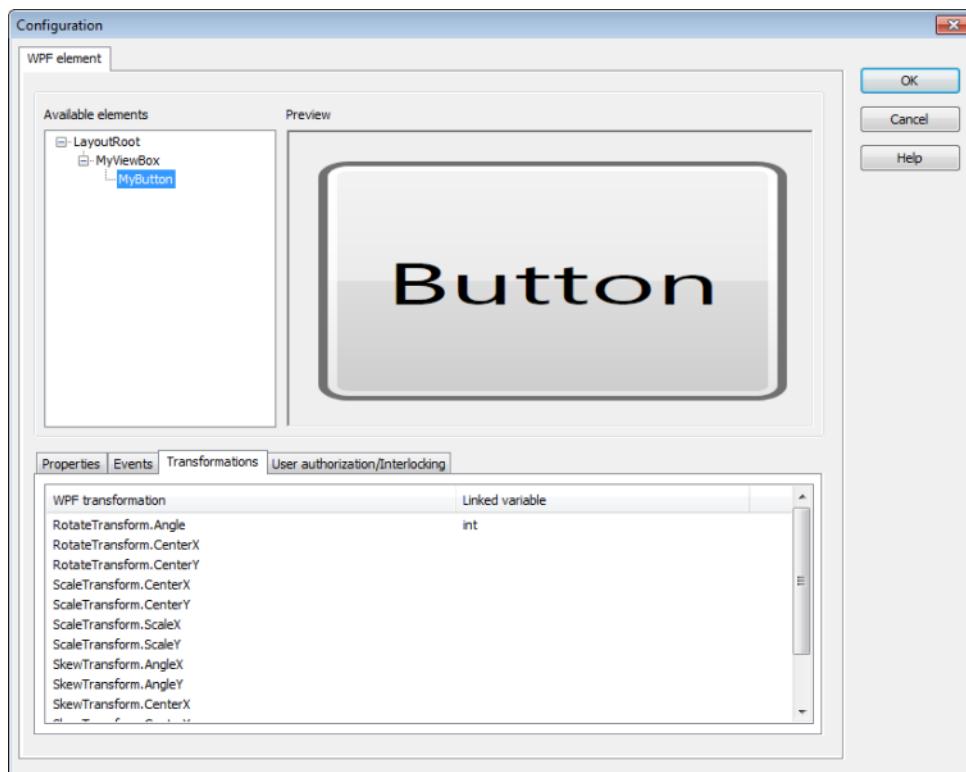

3. Under **Transform** at **RenderTransform** select the **Apply relative transform** option

As a result of this, a block is inserted into the XAML file, which save the transformation settings in runtime.

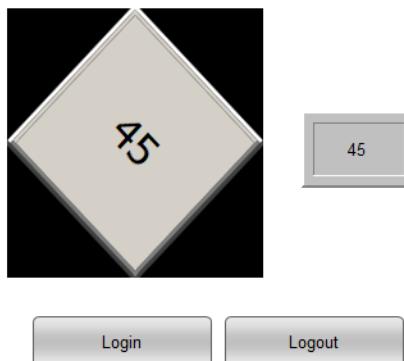

```
<Button.RenderTransform>
  <TransformGroup>
    <ScaleTransform ScaleX="1" ScaleY="1"/>
    <SkewTransform AngleX="0" AngleY="0"/>
    <RotateTransform Angle="0"/>
    <TranslateTransform X="0" Y="0"/>
  </TransformGroup>
</Button.RenderTransform>
```

4. Save the file and replace the old version in zenon with this new file.
5. Open the **WPF element** configuration dialog again:
 - a) select the **MyButton** button
 - b) select the **Transformations** tab

- c) select the **RotateTransform.Angle** element
- d) Click in the **Link type** column
- e) Select **Transformations** from the drop down list
- f) Click in the **Link** column
- g) the variable selection dialog is opened
- h) select the **int** variable to link this variable with the **RotateTransform.Angle** property

Compile the Runtime files and start Runtime. Log in as the **Test** user and click on the button. The button has the value 45 and the **WPF** element rotates by 45°.

Integrate DataGrid Control in zenon

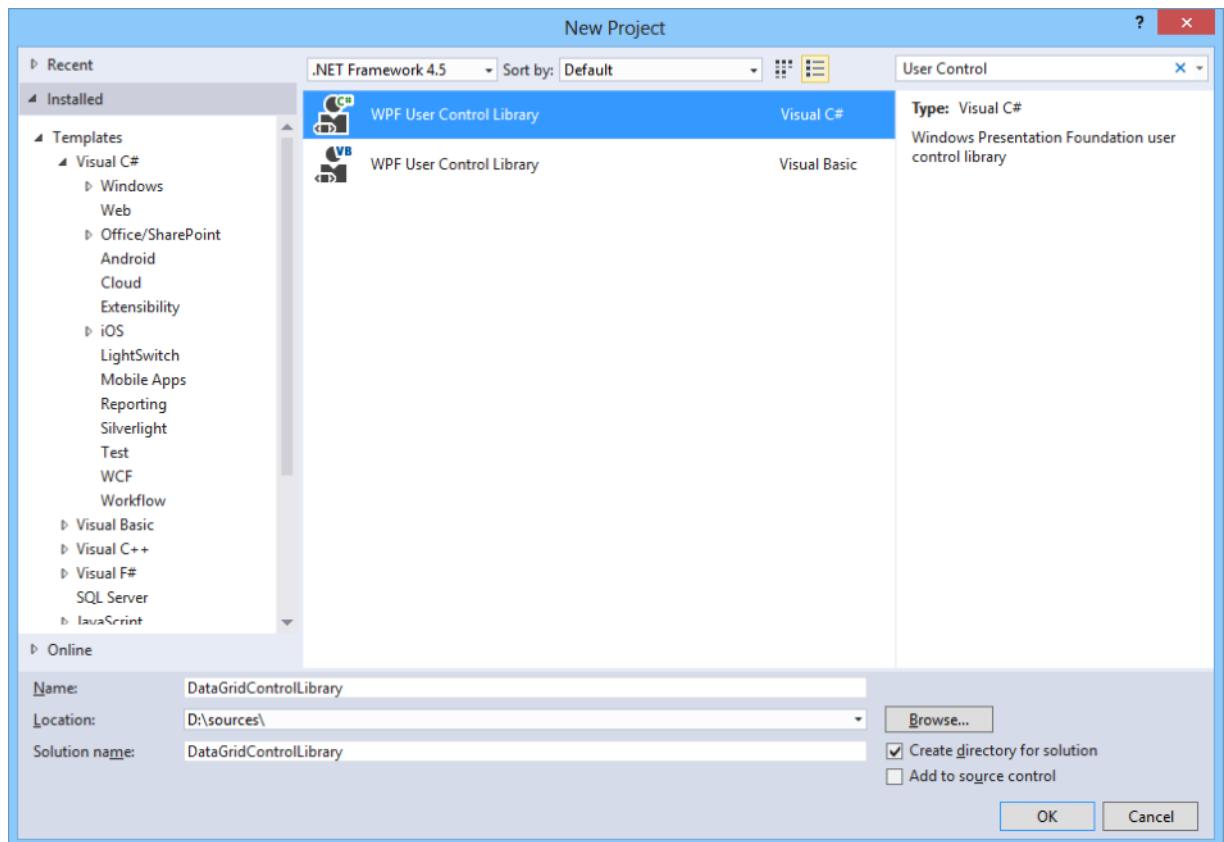

To create DataGrid control for zenon, you need:

- ▶ Visual Studio (Visual Studio 2015 in this example)

CREATE WPF USER CONTROL

1. in Visual Studio, create a new **Solution** and a **WPF User Control Library** project in .NET Framework version 4 or higher therein.

Info: If the corresponding project template does not appear in the list of available templates, this can be added by means of the search (field at the top right of the dialog).

In our example, the project is given the name **DataGridControlLibrary**.

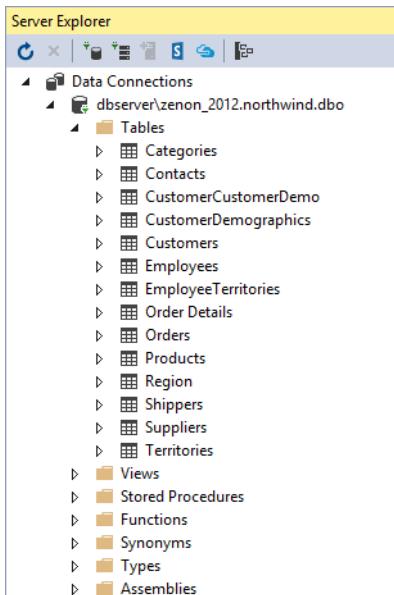

2. Create a new data connection in the **Server Explorer**.

In our example, the database `Northwind` is used, which is provided by Microsoft as an example database that can be downloaded for free.

To set up the database connection:

- a) Right-click on **Data Connections**.
- b) Select **Add connection....**
- c) Select `Microsoft SQL Server (SQLClient)` as **Data source**.
- d) Select the corresponding server and database name.

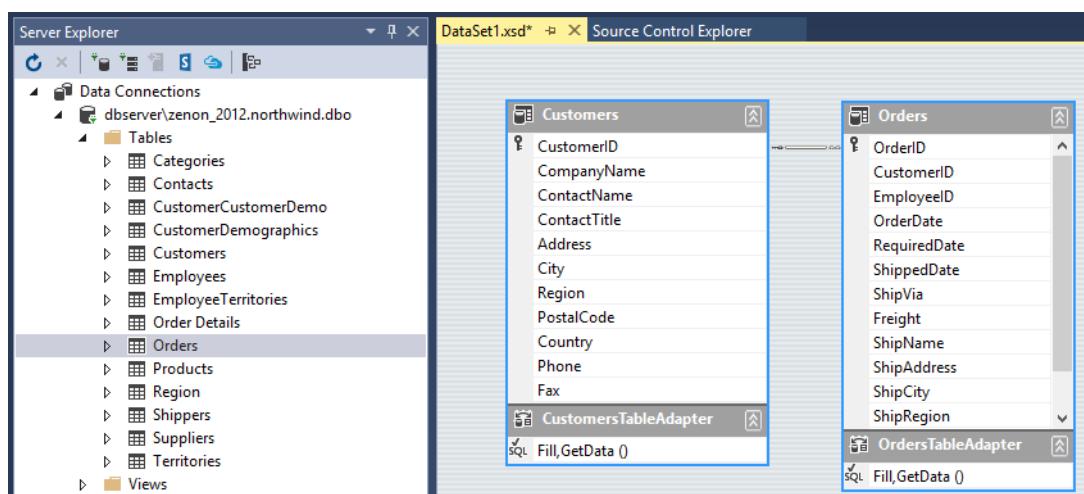

After adding the connection, the Server Explorer window should look a little like this:

A new DataSet is created in the next step.

CREATING A DATASET

1. Right-click on the project
2. Select **Add – New Item...** in the context menu
3. Create a new **DataSet** with the name **DataSet1**.
4. Double click on the DataSet in order to open it in the Designer.
5. Drag the tables that you need (**Customers** and **Orders** in this example) to the DataSet design window.

The XAML file is modified in the next step.

CONFIGURATION OF THE XAML FILE

1. If not already there, add the **Namespace** as a reference to the class in the XAML file:

```
<UserControl x:Class="DataGridControlLibrary.UserControl1"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:d="http://schemas.microsoft.com/expressionblend/2008"
    xmlns:local="clr-namespace:DataGridControlLibrary"
    mc:Ignorable="d"
    d:DesignHeight="300" d:DesignWidth="300">
```

2. Define the resources and the DataGrid that is to be used in the WPF:

```
<UserControl.Resources>

    <local:DataSet1 x:Key="DataSet1"/>

    <CollectionViewSource x:Key="CustomersViewSource" Source="{Binding Path=Customers,
        Source={StaticResource DataSet1}}"/>

</UserControl.Resources>

<Grid DataContext="{StaticResource CustomersViewSource}">

    <DataGrid Name="DataGrid1" DisplayMemberPath="CompanyName"
        ItemsSource="{Binding}" SelectedValuePath="CustomerID"
        HorizontalAlignment="Stretch" VerticalAlignment="Stretch"/>

</Grid>
```

3. Open the code-behind file (**UserControl1.xaml.cs**) and insert the following lines in the constructor:

```
public UserControl1()
{
    InitializeComponent();

    DataSet1 ds = ((DataSet1)(FindResource("DataSet1")));

    DataSet1TableAdapters.CustomersTableAdapter ta = new
        DataSet1TableAdapters.CustomersTableAdapter();

    ta.Fill(ds.Customers);

    CollectionViewSource CustomersViewSource =
        ((CollectionViewSource)(this.FindResource("CustomersViewSource")));

    CustomersViewSource.View.MoveCurrentToFirst();
}
```

In doing so, the following happens:

- The DataSet is obtained
- A new TableAdapter is created
- The DataSet is filled

- The information is provided to the DataGrid control

The solution can now be built.

BUILD

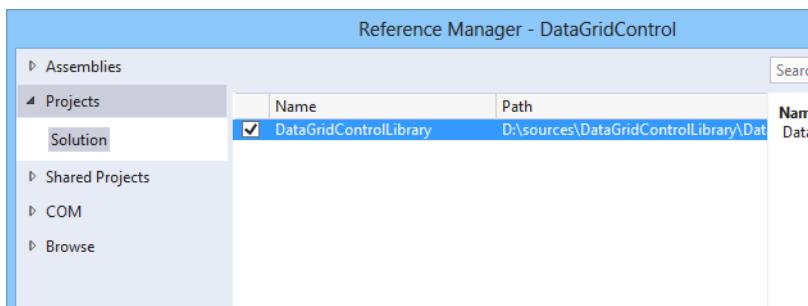

Now build the solution. The corresponding DLL (**DataGridColumnLibrary.dll**) is created in the output folder of the project.

Now you have a DLL with the necessary functionality available.

However zenon can only display XAML files that cannot be linked to the code behind file, which is why an additional XAML file is needed that references the DLL that has just been created.

To do this:

1. Create a further project, again as a **WPF User Control Library**
2. It was called **DataGridColumn** in our example.
3. Insert a reference to the project that has just been built into this new project.

4. The XAML files (**UserControl1.xaml**) looks as follows:

```
<UserControl x:Class="DataGridColumn.UserControl1"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:d="http://schemas.microsoft.com/expressionblend/2008"
    xmlns:local="clr-namespace:DataGridColumn"
    mc:Ignorable="d"
    d:DesignHeight="300" d:DesignWidth="300">
    <Grid>
    </Grid>
</UserControl>
```

5. Because all necessary content is contained in the DLL that has been created and no code-behind is necessary, delete the following lines:

```
x:Class="DataGridColumn.UserControl1"
xmlns:local="clr-namespace:DataGridColumn"
```

6. Also delete (for the positioning) the following lines:

```
mc:Ignorable="d"
d:DesignHeight="300" d:DesignWidth="300"
```

7. Delete the code-behind file (**UserControl1.xaml.cs**) in this project.

8. Define what is to be displayed in the XAML file.

To do this, modify the XAML file as follows:

```
<UserControl xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:dataGridLibrary="clr-namespace:DataGridControlLibrary;assembly=DataGridCo
    ntrolLibrary">

    <Grid x:Name="Grid1">
        <dataGridLibrary:UserControl1 Name="DataGridControl1" HorizontalAlignment="Left"
            VerticalAlignment="Top"/>
    </Grid>
</UserControl>
```

The

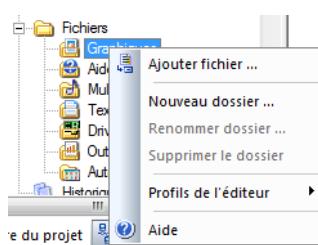

`line``xmlns:dataGridLibrary="clr-namespace:DataGridControlLibrary;assembly=DataGrid
 ControlLibrary"` defines the namespace **dataGridLibrary** and stipulates that this should use
the assembly that has been created.

9. Assign a name for the grid.
10. Insert the control **dataGridLibrary:UserControl1** from our library and give it a name, because
zenon can only modify objects that have a name.
11. Build the solution.

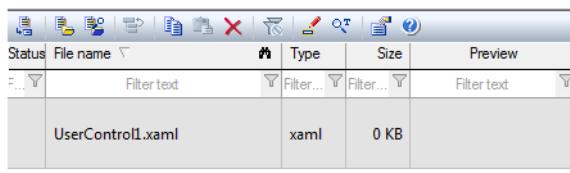

In the next step, how the DLL and XAML file are added to zenon is explained.

STEPS IN ZENON

1. Open the zenon Editor
2. Go to File -> Graphics.
3. Select **Add file...** in the context menu

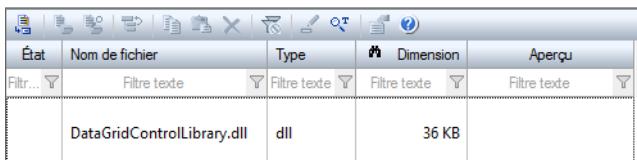

4. Select the XAML file at the save location (**UserControl1.xaml** from the **DataGridControl** project) and add this:

5. Insert the DLL with the functionality for the XAML file.

To do this:

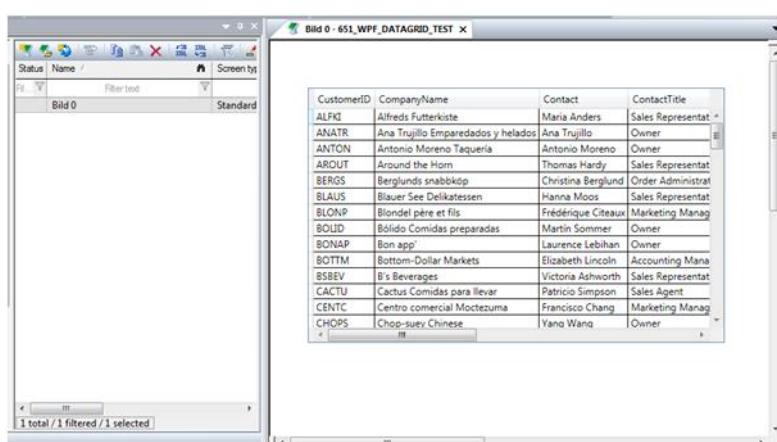

- Select, in the context menu, File -> Other**Add file....**
- Select the file **DataGridControlLibrary.dll** of the first project (**DataGridControlLibrary**).

6. Create a zenon screen.

7. Add a WPF element and select the previously-incorporated XAML file.

You should now see the following in the zenon Editor:

8. Start zenon Runtime in order to also test the control there.

Attention

Assemblies are only removed after loading when the application is ended. This means:

If a WPF file with a referenced assembly in zenon is displayed, then this assembly is loaded is in the memory until zenon is ended, even if the screen is closed again. If you would like to remove an assembly from the Files/Other folder, the Editor must first be restarted, so that the assembly is removed.

6.4.8 Error handling

ENTRIES IN LOG FILES

Entry	Level	Meaning
Xaml file found in %s with different name, using default!	Warning	The name of the collective file and the name of the XAML file contained therein do not correspond. To avoid internal conflicts, the file with the name of the collective file and the suffix .xaml is used.
no preview image found in %s	Warning	The collective file does not contain a valid preview graphic (preview.png or [names of the XAML file].png). Thus no preview can be displayed.
Xaml file in %s not found or not unique!	Error	The collective file does not contain an XAML file or several files with the suffix .xaml . It cannot be used.
Could not remove old assembly %s	Warning	There is an assembly that is to be replaced with a newer version, but cannot be deleted.
Could not copy new assembly %s	Error	A new version is available for an assembly in the work folder, but it cannot be copied there. Possible reason: The old example is still loaded, for example. The old version continues to be used, the new version cannot be used,
file exception in %s	Error	A file error occurred when accessing a collective file.
Generic exception in %s	Error	A general error occurred when accessing a collective file.
